1. Executive Summary

Data is the foundation of modern digital enterprises. Your database platform must deliver consistent performance, availability, scalability, and security to meet evolving business demands and maintain competitiveness.

The global data sphere and database software market continue to grow and with this growth complexity also rising. CXOs and IT teams today face several challenges in managing their database and databases environments:

- Complex software and operational overhead
- Dependency on highly skilled database administrators (DBAs)
- Rising Total Cost of Ownership (TCO) year-on-year

A **database** is an organized collection of digital information used to store, retrieve, and manage data efficiently. Databases exist in many forms and serve various operational and analytical needs.

Traditionally, **relational databases** have dominated the landscape and have long been the backbone of enterprise IT. A **Relational Database Management System (RDBMS)** organizes data into structured tables with rows and columns, enforces ACID compliance, uses a predefined schema and SQL for querying. This model is well-suited for transactional systems requiring data integrity and consistency. RDBMS platforms remain the system of record for mission-critical applications such as ERP, CRM, financial systems, healthcare records, and telecom billing. Their strengths lie in:

- **Data integrity and consistency** — essential for transactional workloads
- **Complex query handling** — unmatched analytical depth using SQL
- **Mature ecosystem and compliance readiness** — proven reliability for regulated industries
- **Modern evolution** — support for JSON, geospatial, in-memory processing, multi-model capabilities, and cloud-native scaling (clusters, replicas, sharding)

Despite their maturity, enterprises often face challenges with RDBMS around license management, operational overhead, and scaling costs. **Managed DBaaS** addresses these issues by simplifying lifecycle management, delivering high availability and security out-of-the-box, and optimizing cost through flexible, cloud-based deployments.

At the same time, the explosion of unstructured and semi-structured data has fuelled the adoption of **non-relational databases (NoSQL)**. These systems offer flexible data models such as document, key-value, in-memory, wide-column, graph, and time-series. NoSQL databases are optimized for high scalability, distributed architecture, and real-time analytics — making them ideal for modern applications like IoT, content management, caching, and search.

NoSQL databases are rising in popularity because they address many of the limitations, NoSQL excels in:

- Horizontal scalability and elastic growth
- Real-time analytics and big data processing
- Developer agility with schema-less design and JSON-native integration
- Optimized performance for specific use cases like caching, IoT, recommendation engines, and search

The future of enterprise data is polyglot persistence — a hybrid approach where RDBMS and NoSQL coexist. RDBMS continues to power mission-critical systems of record, while NoSQL drives innovation in high-volume, real-time, and unstructured workloads.

With the rise of cloud computing, database delivery models have evolved. Customers increasingly seek flexible, cloud-native, and scalable database services that eliminate operational burden and improve cost-efficiency. This has led to the rapid adoption of **Managed Database as a Service (DBaaS)**, empowering organizations to focus on innovation while ensuring their databases — relational or non-relational — remain resilient, performant, and future-ready.

2. Managed Database as a Service (MDBaaS)

Yntraa Cloud offers a comprehensive managed DBaaS portfolio, delivered under two distinct service categories:

- **SutraDB (Relational Databases):** Managed Relational Database as a Service which Includes: MySQL, PostgreSQL, MSSQL and MariaDB.
- **FlexiDB (Non-Relational Databases):** Managed Non-Relational Database as a service (NoSQL), which Includes: MongoDB, Redis, Cassandra, OpenSearch, Elasticsearch, Hadoop, ScyllaDB, Couchbase.

Relational Databases (SutraDB)	Non-Relational Databases (FlexiDB)
• Structured schema: Requires predefined schema with clearly defined tables and data types.	• Flexible schema: Supports dynamic, schema-less, or multi-model structures like document, key-value, graph, columnar, etc.
• Standardized Query Language: Uses SQL (Structured Query Language) for querying and data manipulation	• Varied access methods: Uses APIs, proprietary query languages, or SDKs (e.g., MongoDB Query Language, Redis commands)
• ACID-compliant: Ensures strong data integrity regardless of errors, failures, or other potential mishaps through Atomicity, Consistency, Isolation, Durability.	• BASE model: It stands for Basically Available, Soft state, eventually consistent. It is a DB model used for distribution systems, which can handle large volumes of data and a high degree of concurrency which prioritizes scalability and performance.
• Tabular storage format: Data is stored in structured rows and columns	• Flexible storage formats: Supports JSON, XML, key-value pairs, time series, wide column, etc.
• Vertical scaling (scale-up): Performance improved by increasing server resources (CPU, RAM)	• Horizontal scaling (scale-out): Adds more nodes to handle increasing load and data volume
• Optimized for transactional systems: Best for OLTP, financial systems, ERP, etc.	• Optimized for modern workloads: Ideal for caching, analytics, real-time data, search engines, large-scale data ingestion

Note: Relational databases still dominate the operational database market. IDC forecasts that they will continue to account for over 60% of this market through the near future.

3. Why to Select MDBaaS

- **Managed Infrastructure:** Yntraa Cloud handles the underlying infrastructure, including servers, storage, networking, and system upkeep, reducing operational overhead.
- **Data Residency:** Select your region, where your data needs to be stored within specific geographic area, and not outside country.
- **Flexible choice and Scalability:** Deploy from a wide range of databases and scale compute, memory, or storage seamlessly as workloads grow.
- **High Availability:** Ensure continuous database availability with maximum uptime and business continuity with features like replication, clustering and failover mechanisms.
- **Multi-Level Security:** Robust and reliable multi-level security layer built in to protect your data, including encryption, access controls, and regular security audits to ensure your data is safe.
- **24x7 Monitoring & Expert Support:** Proactive monitoring, automated alerts, and round-the-clock support by database specialists to ensure your workloads run optimally.

Note: This document serves as a reference and specification guide for evaluating **SutraDB** and **FlexiDB** offerings. It outlines supported databases, service deliverables, operational benefits, and guidance for selecting the right managed database service to meet your business requirements.

4. Service Overview

MDBaaS is a fully Managed Database as a Service for Relational Database (SutraDB) and Non-Relational Database (FlexiDB), and it is purpose-built to handle enterprise-scale workloads across diverse use cases. Designed for high performance, security, and reliability, MDBaaS empowers businesses with a scalable, cloud-native database foundation to support data-driven applications that drive value.

High Level Architecture

The diagram illustrates how Yntraa Cloud provisions and manages customer databases through a unified orchestration platform integrated with Kubernetes/container/VM's. Customers interact via the Yntraa Cloud Portal, which communicates with the service orchestrator to trigger automated database deployments. The orchestrator leverages Kubernetes control planes and database operators to create and manage database clusters. Yntraa Cloud supports dedicated cluster models, ensuring scalability, isolation, and operational efficiency across environments.

5. Service Features

Feature Description	Details	Available (Y/N)
Accessibility:	Users interact with DBaaS platforms through intuitive web portals or APIs. These tools simplify database configuration, monitoring, and operations, enabling fast and flexible management.	Y
Cloud-Native Scalability and Resilience	DBaaS solutions are designed for elasticity. Resources such as compute power, memory, and storage can be scaled up or down automatically based on real-time demand, without manual reconfiguration.	Y
Fully Managed Database Instances	Supports both Relational Databases and Non-Relational Databases with automated provisioning, management, and scaling.	Y
High Availability & Automatic Failover	Configurable HA options with automatic failover mechanisms, ensuring minimal downtime.	Y
Automated Backups & Patch Management	Scheduled incremental backups, security patches, and version updates to ensure data integrity and compliance.	Y
On demand Choice and configurations	Multi-zone replication, read replicas, clustering, and failover setup available per customer choice.	Y
Performance Optimization	Compaction tuning, IOPS and CPU monitoring, Cache configuration, connection settings tuning, memory management, index fragmentation checks, etc	Y

Security & Compliance	In-transit and at-rest encryption, role-based access control (RBAC), audit logging, and compliance-ready infrastructure.	Y
Monitoring & Observability	Real-time dashboards, logs, alerts (via Prometheus/Grafana/ELK), and performance metrics.	Y
Configurable Backup & Recovery	Automated daily backups with configurable retention and point-in-time recovery (PITR)	Y
Multi-Tenant or Dedicated Deployments	Based on customer isolation and regulatory needs.	Y
Choice of Editions	Standard/Open Source or Enterprise Editions (e.g., MySQL CE or MySQL Enterprise Edition).	Y
Flexibility - BYOL (Bring Your Own License)	Customer can bring their own licence for MSSQL Web, Standard & Enterprise edition license, but same time they need to have their support subscription from their original OEM's. (For more information, please refer mssql guidelines)	Y
Intelligent Issue Detection & Resolution	Built-in self-healing capabilities with AI-powered issue detection for faster remediation.	Y
Support	Dedicated helpdesk and access to certified database professionals for troubleshooting and guidance.	Y
Reports and Analytics	Health, performance, usage dashboards, and reports are available on portal as well as download reports. Trend reports only available for 6 months. Customise reports can be available on demand. Please refer OneYotta portal as well as cloud portal for user guide and other supporting documents.	Y

6. Scope Of Service

6.1. What is covered in MDBaaS

#	Category	What's Managed	How It Is Done (High-Level)
1	Provisioning	Deploying the database with required configuration	Provisioned through automated workflows that integrate compute, storage, and network resources
2	High Availability (HA)	Multi-node setup with automatic failover	Built-in database clustering and replication with continuous health checks
3	Automated Backups	Scheduled backups with recovery options	Periodic backups stored in secure, durable storage with defined retention policies
4	Point-in-Time Recovery (PITR)	Restore database to a specific timestamp	Transaction log archiving to enable precise recovery within retention limits
5	Monitoring & Alerts	Tracking health, performance, and anomalies	Continuous monitoring with alerting based on predefined thresholds
6	Security	Authentication, encryption, and controlled access	Secure connections, data encryption, access control, and network isolation
7	Automated Patching	OS and database patch updates	Updates applied during planned maintenance windows to minimize impact
8	Upgrades	Version upgrades with minimal downtime	Upgrades performed in a staged manner with verification and rollback options
9	Scaling	Adjusting capacity vertically or horizontally	Resources increased or decreased based on demand, with minimal disruption

10	Basic Troubleshooting	Resolving common operational issues	Proactive detection and automated or guided resolution processes
11	Logging & Auditing (DB Level)	Recording database access and changes	Logging of access events and operations for audit purposes
12	SLA Monitoring & Uptime	Ensuring availability and recovery objectives	Continuous checks to meet agreed uptime and recovery targets
13	Licensing	Managing database licenses	Tracking license usage and ensuring compliance with vendor terms
14	Maintenance Window Management	Planned downtime coordination	Maintenance scheduled in agreed windows with prior notification

Note: Certain advanced or specialized services for Managed DBaaS — such as Disaster Recovery (DR) and Resiliency drills, DBA Administrator, Database migration support, and other extended operational activities — are not included in the standard Managed DBaaS scope. These can be availed through our Cloud Assure or Resiliency Service or Migration Services offerings, which provide the additional expertise, tooling, and process management required for these functions.

6.2. Add-On Services (Subscription Required of Cloud Assure-New Edge Service)

Cloud Assure is Yotta's **Managed Services** layer that provides human-driven operational support beyond the standard scope of Managed Database as a Service.

It covers **advanced administration, ongoing operations, and expert-level tasks** that require continuous human involvement and are outside the platform automation boundary. While DBaaS automates the platform, Cloud Assure includes the **day-to-day operational work** performed by certified database engineers—such as incident handling, log analysis, configuration updates, RCA, backup execution, and cluster administration.

Think of it as **having a dedicated DBA/operations team from Yotta** for any advanced or custom requirement.

DB-Related Task	Yntraa Cloud MDBaaS	Cloud Assure-New Edge Services
-----------------	---------------------	--------------------------------

Provisioning	✅ Fully automated	○ Not required (platform handles it)
Patching	✅ Automated patching	✅ Patch planning, validation, coordination
Backups	✅ Automated backups & PITR	✅ Backup policy compliance + restore execution
Monitoring (Metrics)	✅ Platform-level monitoring	✅ 24×7 alert response + manual troubleshooting
Incident Response	⚠️ Basic auto-heal only	✅ Full incident handling & resolution
Configuration Management	⚠️ Default engine config only	✅ Manual configs, parameter tuning (engine-level)
Replication Management	⚠️ Platform-level setup	✅ Health checks, fixing replica lag, failover help
Upgrades	⚠️ Automated where supported	✅ Full upgrade execution + rollback planning
RCA & Audit Support	❌ Not included	✅ Provided for critical incidents
DR Setup	❌ Not included	✅ Requires DR/Resiliency Subscription in Cloud Assure
DR Testing / DR Drills	❌ Not included	✅ Requires DR/Resiliency Subscription in Cloud Assure
Migration Support	❌ Not included	✅ Requires Cloud Migration Assist in Cloud Assure.
Advanced Query Tuning or Schema / Index Optimization	❌ Not included, we do not look at application-level design issues	❌ Not included, we do not look at application-level design issues

Note: The Foundation Plan of Cloud Assure is already bundled with MDBaaS. For more information, refer Cloud Assure documentation.

Why take Cloud Assure-New Edge Plan?

Customers choose Cloud Assure when they need:

- Human operational support i.e. DBA (Database Administrator), and not just automation.
- You want proactive monitoring and manual intervention. 24x7 monitoring + incident handling, not just alerts.
- Expert DBA assistance for configuration changes, replication checks, user management, cluster admin, upgrades, and troubleshooting.
- RCA and problem management for production issues.
- A single accountable team to manage their database runtime operations.

- Operational governance, audit readiness, and support documentation.
- You want faster response and resolution during incidents.

Cloud Assure ensures the database runs reliably, smoothly, and is actively maintained by experts.

For further details on operational responsibilities, service boundaries, and the complete scope of Managed Services, please refer to the Cloud Assure.

6.3. Customer Responsibility for MDBaaS

When coming to Managed Database as a Service (MDBaaS), there always comes a confusion where customer often thinks that cloud service provider manages and does everything in MDBaaS but in reality, it is a shared responsibility model.

Area	Yntraa Cloud Managed DBaaS (Platform Responsibility)	Cloud Assure- New Edge Service (Operational Responsibility)	Customer Responsibility
Database Provisioning	✓ Automated provisioning, HA setup	○ Not required	—
Patching & Updates	✓ Automated OS/DB patching (where supported)	✓ Patch validation, coordinated rollout	—
Backups & PITR	✓ Automated backups / PITR	✓ Restore execution, backup validation	—
Monitoring	✓ Platform metrics & alerts	✓ Alert response, troubleshooting	—
Scaling	✓ Support vertical/horizontal scaling through platform	—	—
Infrastructure	✓	✓	✗

(Compute, Storage, Network)			
Incident Handling	⚠ Basic auto-healing	✓ Full incident response & RCA	—
Configuration Management	⚠ Default engine configs	✓ Manual config updates & tuning (engine-level)	—
User & Permission Management	—	✓ Performed by Yotta	—
Performance Health Checks	✓ Engine stats & slow query metrics	✓ Basic health review	✗ Deep query tuning / schema redesign
Replication Management	✓ Native replication setup (if supported)	✓ Lag checks, failover assistance	—
Cluster Operations	—	✓ Node recovery, bootstrap, rolling restarts	—
Upgrades	⚠ Automated minor upgrades (where supported)	✓ Major/minor upgrade planning & execution	—
DR Setup	✗ Not included	✗ Not included (Separate DR/Resiliency subscription required)	—
DR Drills	✗ Not included	✗ Not included	—

		(Separate DR/Resiliency subscription required)	
Migration Assistance	✗ Not included	✗ Not included (Separate Migration subscription required)	—
Security & Access Control (Platform)	✓ Infrastructure security, encryption, VPC isolation	✓ DB-level user/role management	✗ Application-level authentication/authorization
Audit, Compliance & RCA	✓ Basic platform logs	✓ RCA for major incidents	✗ Customer's internal audits & governance
Application Logic/ Code	—	—	✓ Query optimization, ORM logic, app debugging
Schema & Index Management	—	⚠ Minor tuning suggestions only	✓ Schema design, index planning, data modelling
Data Responsibility	Protect and store customer data securely	—	✓ Data correctness, business logic, retention decisions
Third-Party Integrations	—	—	✓ ETL/BI tool integration & maintenance
Non-Supported Versions/Engines	✗ Not supported	✗ Not supported	✓ Customer-owned responsibility

7. Service Plans

The Plan and Pricing for Yntraa Cloud Managed Database as a Service vary based on the database engine chosen, the database edition choose (Opensource/Standard or Enterprise), and the underlying infrastructure configuration (VM, container, Network, Storage, Backup, etc.).

Customers can choose between two plan models — On-Demand (pay-as-you-go) and Fixed-Term Plans (committed usage). Additionally, Savings Plans are available to optimize overall cost and reduce total expenditure, depending on usage patterns and commitment.

To Keep your cost transparent and flexible, the database SKU and infrastructure SKU are separated. This ensures you pay only for the exact infrastructure you need — not bundled, pre-marked-up instance sizes found in other cloud platforms. At the end, the end user receives the PaaS DBaaS only as a fully managed offering. The total DBaaS cost is calculated as the sum of the **Database SKU (foundational managed services/support, OS and license)** and the separately billed **infrastructure components** (compute, memory, storage, network, and security).

Product Bundle	Plan Name	Plan Description
Managed Database as a Service	Managed DBaaS-MySQL Opensource	Managed Database as a Service – MySQL - Fully managed MySQL Community Edition with automated updates, patches, monitoring, backups and support. It is a cost-effective, proven relational DB for transactional workloads. Includes subscription of free to use open-source license (GPL v2) and support for per core. - Infrastructure is separate and chargeable extra. Based on no. of core required, select the quantity. An additional unit is needed for every per-core.
Managed Database as a Service	Managed DBaaS-MySQL Enterprise	Managed Database as a Service – MySQL - Fully managed Enterprise edition MySQL with enhanced performance, security, and enterprise-grade support. Ideal for mission-critical, high-performance relational workloads. Includes subscription of Enterprise edition database license (subject to minimum 16 core) and support. - Infrastructure is separate and chargeable extra. Based on no. of core required, select the quantity. An additional unit is needed for every per-core (Minimum 16 core is required

		and choose in multiple of 16)
Managed Database as a Service	Managed DBaaS- PostgreSQL Opensource	Managed Database as a Service – PostgreSQL - Fully managed PostgreSQL Community Edition with automated updates, patches, monitoring, backups and support. It is a robust advanced open-source database for OLTP and ideal for small to mid-sized transactional and analytical workloads. Includes subscription of free to use open-source license (Postgresql License) and support for per core - Infrastructure is separate and chargeable extra. Based on no. of core required, select the quantity. An additional unit is needed for every per-core.
Managed Database as a Service	Managed DBaaS- PostgreSQL Enterprise	Managed Database as a Service – PostgreSQL - Fully managed Enterprise edition PostgreSQL with enhanced features, security, and enterprise-grade support. Suitable for large-sized transactional, mission critical and analytical workloads. Includes subscription of Enterprise edition database license (subject to minimum 8 core license) and support for per-core. - Infrastructure is separate and chargeable extra. Based on no. of core required, select the quantity. An additional unit is needed for every per-core (Minimum 8 core needed to be subscribed).
Managed Database as a Service	Managed DBaaS- MSSQL Standard	Managed Database as a Service – MSSQL - Fully managed Microsoft SQL STANDARD Edition. Ideal for balanced performance for moderate workloads with Microsoft ecosystem. Includes subscription of Standard edition license (minimum 4 cores to be subscribed) and support for per-core. - Infrastructure is separate and chargeable extra. Based on no. of core required, select the quantity. An additional unit is needed for every per core (Minimum 4 core is required).
Managed Database as a Service	Managed DBaaS- MSSQL Enterprise	Managed Database as a Service – MSSQL Fully managed Microsoft SQL Enterprise Edition. Ideal for high scalability, advanced analytics, and mission-critical workloads with Microsoft ecosystem. Includes

		subscription of Enterprise edition license (minimum 4 cores to be subscribed) and support for per-core. Infrastructure is separate and chargeable extra. Based on no. of core required, select the quantity. An additional unit is needed for every per core (Minimum 4 core is required).
Managed Database as a Service	Managed DBaaS- MariaDB Opensource	Managed Database as a Service – MariaDB - Fully managed MariaDB Community edition with automated updates, patches, monitoring, backups and support. It is Lightweight, cost-efficient SQL database for modern apps. Includes subscription of free to use open-source license (GPL v2) and support for per-core. - Infrastructure is separate and chargeable extra. Based on no. of core required, select the quantity. An additional unit is needed for every per core.
Managed Database as a Service	Managed DBaaS- MariaDB Enterprise	Managed Database Service – MariaDB - Fully managed Enterprise edition MariaDB with Galera Cluster, advanced features, security, scalability, and enterprise-grade support. Built for efficient workload handling and high availability. Includes subscription of per-instance Enterprise edition license (minimum 3 instances to be subscribed for HA) and support. - Infrastructure is separate and chargeable extra. Based on no. of instance required, select the quantity. An additional unit is needed for each extra instance.
Managed Database as a Service	Managed DBaaS- MongoDB Opensource	Managed Database as a Service – MongoDB - Fully managed MongoDB Community edition with automated updates, patches, monitoring, backups and support. It is a NoSQL document database optimized for unstructured data and real-time analytics. Includes subscription of free to use open-source license ie SSPL (subject to minimum 3 nodes for HA) and support for per GB RAM. - Infrastructure is separate and chargeable extra. Based on no. of GB RAM required, select the quantity. An additional unit is needed for every per GB per node.

Managed Database as a Service	Managed DBaaS-MongoDB Enterprise	Managed Database as a Service – MongoDB - Fully managed Enterprise edition MongoDB with advanced features, security, scalability, and enterprise-grade support. It is a NoSQL document database optimized for unstructured data and real-time analytics for mission-critical workloads. Includes subscription of Enterprise edition database license (256GB RAM per each node, with minimum 3 nodes to be subscribed for HA) and support for per GB RAM. - Infrastructure is separate and chargeable extra. Based on no. of GB RAM required, select the quantity. An additional unit is needed for every per GB per node (minimum 256GB RAM per each node).
Managed Database as a Service	Managed DBaaS-Redis Opensource	Managed Database as a Service – Redis - Fully managed Redis Community edition for caching, real-time analytics and session storage. It is a Low-latency, cost-effective, high-speed caching and in-memory data store for performance of critical apps. Includes subscription of free to use open-source license (BSD 3-Clause) and support for per GB RAM. - Infrastructure is separate and chargeable extra. Based on no. of GB RAM required, select the quantity. An additional unit is needed for every per GB RAM.
Managed Database as a Service	Managed DBaaS-Redis Enterprise	Managed Database as a Service – Redis - Fully managed, Enterprise edition Redis for caching, real-time analytics, and session storage with advanced features, security, scalability, and enterprise-grade support. It is suitable for mission-critical low-latency workloads with HA & persistence. Includes subscription of Enterprise edition database license (25GB RAM per each shard, with minimum 2 shard to be subscribed for HA) and support cost for per GB per-shard. - Infrastructure is separate and chargeable extra. Based on no. of GB RAM required, select the quantity. An additional unit is needed for every per GB per shard (minimum 25GB per each shard).

Managed Database as a Service	Managed DBaaS- Cassandra Opensource	Managed Database as a Service – Cassandra - Fully managed Apache Cassandra Community edition with automated updates, patches, monitoring, backups and support. It is a distributed NoSQL database optimized for high-write throughput, scalability, and resilient architecture. Includes subscription of free to use open-source license (Apache License 2.0, with minimum 3 nodes to be subscribed for HA) and support for per-core. - Infrastructure is separate and chargeable extra. Based on no. of core required, select the quantity. An additional unit is needed for every per core.
Managed Database as a Service	Managed DBaaS- Cassandra Enterprise	Managed Database as a Service – Cassandra - Fully managed Enterprise edition CASSANDRA with advanced features, security, scalability, and enterprise-grade support. It is a distributed NoSQL database optimized for high-write throughput, scalability, and resilient architecture for mission critical workloads and resilience. Includes subscription of Enterprise edition database license (minimum 3 nodes of 16 cores each to be subscribed for HA) and support for per-core - Infrastructure is separate and chargeable extra. Based on no. of core required, select the quantity. An additional unit is needed for every per core (Minimum 16 core per each node).
Managed Database as a Service	Managed DBaaS- OpenSearch Opensource	Managed Database as a Service – OpenSearch - Fully managed OpenSearch Community Edition with automated updates, patches, monitoring, backups and support. It is a database for search, observability, log management, and analytics dashboards. Includes subscription of free to use open-source license (Apache License 2.0, with minimum 3 nodes of 64GB RAM each to be subscribed for HA) and support for per-GB RAM. - Infrastructure is separate and chargeable extra. Based on no. of GB RAM required, select the quantity. An additional unit is needed for every per GB RAM per node.

Managed Database as a Service	Managed DBaaS- Elasticsearch Enterprise	Managed Database as a Service – Elasticsearch - Fully managed Enterprise edition Elasticsearch engine with advanced features, security, scalability, and enterprise-grade support for real-time text search, analytics, and log monitoring. Supports scalable clusters and observability integrations. Includes subscription of Enterprise edition database license (minimum 3 nodes of 64GB RAM each to be subscribed for HA) and support for per GB RAM. - Infrastructure is separate and chargeable extra. Based on no. of GB RAM required, select the quantity. An additional unit is needed for every per GB per node (64GB RAM per each node).
Managed Database as a Service	Managed DBaaS- Hadoop Opensource	Managed Database as a Service – Hadoop - Fully managed, Hadoop Community Edition with automated updates, patches, monitoring, backups and support. It is a big data framework for batch processing, ETL, and large-scale analytics with tools including HDFS, YARN, with optional support for Hive, Spark, and other Hadoop ecosystem tools. Includes subscription of free to use open-source license (Apache License 2.0, with minimum 5 nodes: 1 NameNode, 1 ResourceManager, 3 DataNodes) and support for per-core. - Infrastructure is separate and chargeable extra. Based on no. of core required, select the quantity. An additional unit is needed for every per core per node.
Managed Database as a Service	Managed DBaaS- ScyllaDB Enterprise	Managed Database as a Service – ScyllaDB - Fully managed, Enterprise edition ScyllaDB with advanced features, security, scalability, and enterprise-grade support. It is suitable for ultra-low latency and high-throughput workloads for real-time, large-scale distributed systems. Includes subscription of Enterprise edition database license (with minimum 3 nodes to be subscribed for HA) and support for per-core per TB storage. - Infrastructure is separate and chargeable extra. Based on no. of core required, select the quantity and based on no. of TB of storage, select the quantity. An additional unit is

		needed for each extra core and each extra TB storage.
Managed Database as a Service	Managed DBaaS- Couchbase (Distributed NoSQL) Opensource	Managed Database as a Service – Couchbase - Fully managed Couchbase Community Edition with automated updates, patches, monitoring, backups and support. It is a distributed NoSQL database optimized for interactive applications, caching, and real-time data access. Includes subscription of free to use open-source license (Couchbase Community License, with minimum 3 nodes to be subscribed for HA) with support cost per-core. - Infrastructure is separate and chargeable extra. Based on no. of core required, select the quantity. An additional unit is needed for every per-core per node.
Managed Database as a Service	Managed DBaaS- Couchbase Enterprise	Managed Database as a Service - Couchbase Fully managed, Enterprise edition Couchbase with advanced features, security, scalability, and enterprise-grade support. It is suitable for advanced analytics, XDCR filtering and Optimized for HA. Includes subscription of Enterprise edition database license (minimum 3 nodes of 4 cores each to be subscribed for HA) and support for per-core. - Infrastructure is separate and chargeable extra. Based on no. of core required, select the quantity. An additional unit is needed for every per-core per node (minimum 4 cores per each node).

Note: Regarding Oracle Database, it is not offered under Managed DBaaS due to Oracle's strict licensing policies and restrictions on providing it as a native DBaaS service. However, customers who wish to use Oracle under a Bring Your Own License (BYOL) model can do so through Yntraa Cloud Assure – New Edge Services, which provides managed service support, and compliance alignment for Oracle workloads.

8. Service Support and SLA

The 24x7 Support Desk provides a central point of contact between customers and our cloud operations team. It encompasses a range of services reaching beyond the typical Help Desk, including:

- Ability to process incidents and complaints.

- Process Change and Service Requests using IT service management processes, i.e., Release Management, Configuration Management, Problem Management, etc.
- Call & Ticket Management functions.
- Our Support Desk encompasses Call Centre and Help Desk Activities, shortening the incident life cycle efficiently.

We have a strong team of highly skilled, experienced project managers who have implemented complex projects. They provide Customers with value-added benefits such as risk management, clear communication, and greater visibility throughout the project life cycle.

Yntraa Cloud provides basic level support (Foundation Plan) at no additional charge for the Cloud Services or Customer can select available fee-based technical support offerings with a specified minimum commitment and charges.

Any selected fee-based technical support offerings will be associated with and charged based on the level of use of the eligible Cloud Service, including any overage charges. Further details on support offerings can be found at <https://cloudassure/docs/get-supportplans>.

Customers may submit a support ticket describing an issue in accordance with the applicable support policy procedures. The support policies are available in Cloud documentation and provide details of available support options, as well as information on access, support business hours, severity classification, and support resources and limitations. YNTRAA CLOUD uses commercially reasonable efforts to respond to support requests; however, there is no specified response time objective for basic level support.

Unless otherwise agreed in writing, support is available only to Customer (and its authorized users) and not to any end users of Customer's solutions. Customer is solely responsible for providing all customer support and services to its end users.

Support for Non-Yntraa Cloud Products is provided by the third-party vendor and may require a separate support contract.

Service Level Agreements

Yntraa Cloud provides the following service level agreements (SLAs) for Cloud Services when Yntraa Cloud is listed as the Provider value in the Yntraa Cloud Catalog. For 3rd party services, the SLA, if provided, will be set out in the 3rd party vendor terms for that service. SLA credits are Client's exclusive remedy for Yntraa Cloud's failure to meet a specified service level.

Yntraa Cloud will validate SLA claims based upon information provided by Client and Yntraa Cloud system records and will notify Client of approved credits via the Cloud UI or email. Yntraa Cloud's reasonable determination of a credit is final. Customers agree to continue to make payments in full for Cloud Services while an SLA claim is being reviewed.

Service level agreements (SLAs) for Cloud Services are described in the Service Level Agreement document, please refer to the Cloud and Cloud Assure Service SLA document for details.

9. Service Transition and Migration

Service Transition and Migration refer to the process of moving services from an existing operational state to a new or modern environment — such as transitioning from a legacy system to a cloud-native platform or migrating from on-premises databases to the cloud. This phase is critical in the IT Service Management (ITSM) lifecycle and is aligned with ITIL best practices.

At Yntraa Cloud, we recognize the importance of seamless transitions. Our specialists follow proven methodologies and industry standards to ensure that new or modified services are integrated into your operations with **minimal disruption, zero data loss, and maximum business continuity**.

This offering is available as a **Value-Added Service** under **Yntraa Cloud Assure**, which includes:

- **Transition Services** – structured movement of services into Yntraa Cloud. It addresses the broader shift of services and workloads into the Yntraa Cloud ecosystem. It ensures that not just databases, but supporting infrastructure, integrations, and operational processes are smoothly transitioned.
- **Migration Assist Services** – expert-led database migration with minimal downtime. It involves transferring data from one environment to another — whether between servers, storage systems, platforms, or cloud environments. There are two types of database migration services:

1. Homogeneous Database Migration:

Migration between the same database engine where schema structure, data types, and code are largely compatible.

- Example: SQL Server → SQL Server, PostgreSQL → PostgreSQL, MySQL → MySQL
- Typically, lower risk and faster execution.
- Tools used: Native tools or utilities like Oracle Data Pump, SQL Server Integration Services (SSIS), pg_dump/pg_restore.

2. Heterogeneous Database Migration

Migration between different database engines, requiring schema conversion, code adaptation, and application alignment.

- Example: Oracle → PostgreSQL, SQL Server → Azure SQL, NoSQL → SQL migrations.
- Involves transformation of schemas, stored procedures, and business logic.
- Tools used: AWS DMS, Azure DMS, SQL Server Migration Assistant (SSMA), Flyway, Liquibase, etc.

Note: Any required **software, licenses, or migration tools** will be charged separately as applicable.

Value Added Service high level processes and practices which is followed at Yntraa Cloud. High level details, scope and steps are elaborated below. For more information refer to Cloud Assure.

1. Assessment & Planning	Objectives: - Understand the current database environment. - Define the scope, business drivers, and success criteria. - Identify risks, dependencies, and compliance requirements.	Key Activities: - Inventory of databases, schemas, stored procedures, ETL jobs, etc. - Performance and usage analysis. - Define downtime windows and rollback strategies. - Choose migration type: Lift-and-shift, deplatforming, or refactoring.
2. Design & Strategy Development	Objectives: - Define the target architecture and migration strategy. - Ensure compatibility and alignment with business needs.	Key Activities: - Select target database platform (e.g., Oracle → PostgreSQL, SQL Server → Azure SQL). - Define the data model and transformation rules. - Design backup, failover, and disaster recovery solutions. - Plan for testing, validation, and go-live sequencing.
3. Environment Preparation	Objectives: Set up the destination environment to support migration.	Key Activities: - Provision hardware or cloud resources. - Install and configure the target DBMS. - Set up network connectivity, security,

		and user access controls. Establish monitoring and logging systems.
4. Data Migration Execution	Objectives: Transfer database objects and data with accuracy and minimal downtime.	Key Activities: - Export/import schema objects (tables, views, indexes). - Perform data transfer using tools like: - Oracle Data Pump, SQL Server Integration Services (SSIS), AWS DMS, Azure Database Migration Service, etc. - Apply transformation or cleansing rules as needed. - Synchronize changes if incremental updates or delta syncs are required.
5. Validation & Testing	Objectives: Ensure the integrity, performance, and functionality of the new database environment.	Key Activities: - Run data integrity checks (row counts, checksums, referential integrity). - Conduct functional testing (queries, stored procedures, applications). - Perform performance and load testing. - Carry out user acceptance testing (UAT).
6. Cutover & Go-Live	Objectives: Switch operations to the new environment with minimal disruption.	Key Activities: - Final data sync (if needed). - Update connection strings and application configurations. - Implement DNS changes or service routing. - Execute cutover plan with rollback option.
7. Post-Migration Support & Optimization	Objectives: Ensure operational readiness and tune the new environment for	Key Activities: - Monitor system performance and usage. - Tune queries, indexes, and cache settings. - Conduct knowledge transfer to

	optimal performance.	operations/support teams. Update documentation and configuration management databases (CMDB).
8. Closure & Review	Objectives: Evaluate the success of the migration and document lessons learned.	Key Activities: - Post-implementation review with stakeholders. - Close out issues and update service records. - Archive logs and audit trails. - Document process improvements.
9. Tools Used	- Oracle Data Pump, RMAN, SQL Server Migration Assistant (SSMA) - AWS DMS, Azure DMS, Google Database Migration Service - Flyway, Liquibase for version-controlled migrations - There are many tools, data movers etc. used	

10. Service Certification & Accreditation

Yntraa Cloud is dedicated to delivering a secure, reliable, compliant and trusted cloud environment. To uphold these standards, Yntraa Cloud has obtained a wide range of certifications and accreditations, reflecting its adherence to international security standards and industry best practices. These credentials not only demonstrate Yntraa Cloud's commitment to robust data protection and service reliability but also assist customers in meeting their own regulatory and compliance obligations across various industries. Certifications and accreditations are highlighted below.

- ISO/IEC 20000-1:2018:** Certifies its capability to manage IT service management systems, ensuring effective delivery of managed IT services in alignment with business objectives.
- ISO 9001:2015:** Demonstrates the commitment to maintaining a high level of quality in its service delivery processes, ensuring customer satisfaction and continuous improvement.
- ISO/IEC 27001:2013:** This certification ensures that it maintains a robust Information Security Management System (ISMS). It certifies its ability to protect sensitive information and meet international security standards.
- ISO/IEC 27017:2015 (Cloud Security):** Focuses on the additional security controls

required for cloud services, ensuring a secure cloud environment for its customers.

- **ISO/IEC 27018:2019 (PII Protection):** Ensures the protection of Personally Identifiable Information (PII) within the cloud. This certification demonstrates Yntraa Cloud's commitment to safeguarding customer data privacy.
- **PCI-DSS (Payment Card Industry Data Security Standard):** Yotta's data centers are certified to store and process payment card data in compliance with the rigorous PCI-DSS standards, ensuring secure handling of sensitive financial information.
- **ISO 14001:2015:** Yntraa Cloud adheres to international environmental management standards, showcasing its commitment to sustainable and environmentally friendly practices.
- **ISO 45001:2018 (Occupational Health and Safety):** Reflects Yotta's commitment to ensuring the health and safety of its workforce while delivering services to its customers.
- **MEITY Empanelment:** Yotta's data centers are empanelled by the Ministry of Electronics and Information Technology (MEITY), allowing government bodies and public sector enterprises to host their cloud services in a compliant and secure environment.
- **Tier IV Certification:** Yotta operates Tier IV data centers, providing the highest level of fault tolerance and redundancy. This ensures a reliable and uninterrupted service with 99.995% uptime.
- **Open IX (OIX-2) Certification:** This certification attests that Yotta's data center facilities meet the stringent infrastructure, and operational standards required by the Open IX community for interconnection and data transmission.
- **Hyperscale Innovation in Automation:** It was recognized for its leadership in delivering automated, scalable cloud services.
- **Excellence in Datacenter:** This award acknowledges Yotta's innovative approach to data center architecture and service delivery.

11. Annexures

Yntraa Managed Database as a Service

The Yntraa Managed Database as a Service portfolio contains database-as-a-service offerings on Yntraa Cloud®. In addition to the comprehensive information in the Yntraa Cloud® Managed Databases as a service documentation, links to additional sources of information are provided below.

1. Yntraa Cloud® Managed Databases as a service for MYSQL

MySQL is one of the world's most popular open-source relational databases, trusted for delivering high-performance, read-intensive applications. It reduces the time, cost, and risk of developing, deploying, and managing business-critical applications while ensuring reliability, security, and scalability.

SutraDB – MySQL:

Yntraa Cloud offers MySQL as a fully managed service, handling provisioning, patching, monitoring, high availability, backups, and scaling. This enables businesses to focus on innovation and applications while we ensure uptime, performance, and lifecycle automation.

We offer following options of subscription:

- **MySQL Community Edition Plan:** The MySQL Community Support Plan provides access to an open-source version of MySQL database as a fully managed service by Yntraa Cloud. Includes monitoring, patching, and operational support, making it suitable for development, testing, and small to medium workloads.
- **MySQL Enterprise Edition Plan:** The MySQL Enterprise Edition Plan provides the commercial MySQL Enterprise edition as a fully managed service by Yntraa Cloud. Includes advanced features such as high availability, security enhancements (encryption, auditing), and compliance support. Ideal for mission-critical and large-scale production workloads.

For more information, please visit:

For Documentation	https://www.mysql.com/products/enterprise/compare/ https://www.mysql.com/products/enterprise/ https://dev.mysql.com/doc/
For detailed PSS (Product Specification Sheet)	Refer in Athena

2. Yntraa Cloud® Managed Databases as a service for PostgreSQL

PostgreSQL is a powerful open-source relational database known for its robustness, reliability, and extensibility. It supports advanced SQL features, strong data integrity, and scalability, making it one of the most trusted databases for transactional and analytical workloads.

SutraDB – PostgreSQL

Yntraa Cloud offers PostgreSQL as a fully managed database service, taking care of provisioning, monitoring, patching, scaling, high availability, and backups. With enterprise-grade security and compliance support, businesses can leverage PostgreSQL for critical workloads while Yntraa Cloud ensures operational reliability and performance.

We offer following options of subscription:

- PostgreSQL Community Edition Plan:** The PostgreSQL Community Edition Plan provides the open-source PostgreSQL database as a fully managed service. Includes lifecycle automation, monitoring, patching, and operational support. Best suited for developers, startups, and small to mid-sized applications.
- PostgreSQL Enterprise Edition Plan:** It provides the commercial PostgreSQL Enterprise edition as a fully managed service. Includes advanced features such as high availability (HA), automated backups and patching, enhanced security, and compliance support. Ideal for enterprise-grade, mission-critical workloads.

For detailed PSS (Product Specification Sheet)	Refer in Athena

3. Yntraa Cloud® Managed Databases as a service for MS SQL

Microsoft SQL Server (MSSQL) is a widely used relational database management system designed to deliver high performance, scalability, and robust data security. It supports advanced analytics, in-memory processing, and integration with Microsoft's ecosystem, making it ideal for transactional, analytical, and hybrid workloads.

SutraDB – MSSQL

Yntraa Cloud provides MSSQL as a fully managed service, taking care of setup, monitoring, patching, backups, scaling, and high availability. With built-in compliance, enterprise-grade security, and performance optimization, SutraDB-MSSQL enables businesses to run critical applications without the burden of database administration.

We offer following options of subscription:

- MSSQL Standard Edition Plan:** The MSSQL Standard Support Plan provides Microsoft SQL Server Standard Edition as a fully managed service. Includes automated backups, patching, monitoring, and lifecycle management. Best suited for mid-sized businesses and general-purpose workloads.
- MSSQL Enterprise Edition Plan:** The MSSQL Enterprise Support Plan provides Microsoft SQL Server Enterprise Edition as a fully managed service. Includes advanced features such as Always on Availability Groups, Transparent Data Encryption (TDE), high availability, and enterprise security. Ideal for large-scale, mission-critical applications.

4. Yntraa Cloud® Managed Databases as a service for MariaDB

MariaDB is a high-performance, open-source relational database that's SQL-compatible and widely used as a drop-in replacement for MySQL. It's built for transactional workloads, supports rich indexing and replication, and offers strong reliability and scalability for modern applications.

SutraDB – MariaDB

Yntraa Cloud provides MariaDB as a fully managed service—covering provisioning, monitoring, patching, backups, scaling, and high availability—so your teams can focus on application delivery while we ensure uptime, performance, and security.

We offer following options of subscription:

- **MariaDB Community Edition Plan:** MariaDB Community Edition Plan provides a fully managed community edition of MariaDB with lifecycle automation, monitoring, patching, and operational support. Suitable for development, test, and small to mid-size production workloads seeking a cost-effective SQL database.
- **MariaDB Enterprise Edition Plan:** MariaDB Enterprise Edition Plan provides a fully managed MariaDB Enterprise Server. This version is designed for mission-critical applications and includes advanced features such as data-at-rest encryption, high availability with MariaDB Cluster or Replication, and enhanced security controls.

5. Yntraa Cloud® Managed Databases as a service for MongoDB

MongoDB is a leading NoSQL, document-oriented database that stores data in flexible, JSON-like formats. It is widely adopted for applications requiring dynamic schemas, real-time analytics, and scalability across large datasets. Its ability to handle unstructured and semi-structured data makes it ideal for modern web, mobile, IoT, and big data applications.

FlexiDB – MongoDB

Yntraa Cloud delivers MongoDB as a fully managed service, simplifying operations such as provisioning, patching, scaling, monitoring, and backups. By offloading database management, organizations can focus on building innovative applications while relying on a secure, scalable, and high-performance MongoDB deployment.

We offer following options of subscription:

- MongoDB Community Edition Plan:** The MongoDB Community Edition Plan provides fully managed, open-source MongoDB version, including features like JSON document storage, indexing, and replication. Support, along with lifecycle management, monitoring, and backups, making it suitable for development, testing, and small-to-medium scale applications.
- MongoDB Enterprise Edition Plan:** The MongoDB Enterprise Edition Plan provides a fully managed, production-ready environment designed for mission-critical applications. It includes advanced features such as enterprise-grade security (encryption at rest and in transit, role-based access control), automated scaling, high availability with replica sets, and performance optimization.

6. Yntraa Cloud® Managed Databases as a service for Redis

Redis is a high-performance, in-memory key-value data store, widely used as a database, cache, and message broker. It is known for delivering sub-millisecond response times, making it ideal for use cases such as caching, session management, leaderboards, queues, and real-time analytics.

FlexiDB – Redis

Yntraa Cloud provides Redis as a fully managed service, ensuring automated provisioning, scaling, patching, monitoring, and backups. By removing operational complexity, FlexiDB – Redis enables businesses to leverage Redis's extreme speed and versatility while focusing on application innovation and growth.

We offer following options of subscription:

- **Redis Community Edition Plan:** The Redis Community Edition Plan offers open-source Redis, ideal for caching, real-time analytics, and high-speed data operations. Includes in-memory data storage, replication, and lifecycle management with support. Best suited for development, small-to-medium workloads, and applications where ultra-low latency is critical.
- **Enterprise Edition Plan:** The Redis Enterprise Edition Plan provides a fully managed, highly available and resilient environment with features such as Redis Cluster for horizontal scaling, Active-Active geo-distributed replication, durability with persistence, automatic failover, and enterprise-grade security. This plan is optimized for mission-critical workloads that demand continuous availability and consistent sub-millisecond performance.

7. Yntraa Cloud® Managed Databases as a service for Cassandra

Apache Cassandra is a highly scalable, distributed NoSQL database designed to handle massive amounts of data across multiple nodes without a single point of failure. It excels in high availability and fault tolerance, making it ideal for applications that require continuous uptime and linear scalability, such as IoT platforms, time-series data, recommendation engines, and large-scale transactional systems.

FlexiDB – Cassandra

Yntraa Cloud provides Cassandra as a fully managed service, automating cluster deployment, monitoring, backups, patching, and scaling. By removing operational complexities, FlexiDB – Cassandra allows organizations to harness Cassandra’s distributed architecture and resilience while focusing on building data-driven applications.

We offer following options of subscription like:

- Cassandra Community Edition Plan:** The Cassandra Community Edition Plan provides the open-source Apache Cassandra version, Includes replication, high availability, and scalability features with full lifecycle management and support. Best suited for applications that require large-scale distributed data handling but can work with community feature sets.
- Cassandra Enterprise Edition Plan:** The Cassandra Enterprise Edition Plan provides a fully managed, enterprise-class enhancement such as automated performance optimization, advanced security, multi-cloud replication, durability with managed backups, and high availability. This plan is designed for business-critical, always-on workloads.

8. Yntraa Cloud® Managed Databases as a service for Opensearch

OpenSearch is a fully open-source search and analytics engine derived from Elasticsearch, designed for real-time search, log analytics, monitoring, and observability use cases. It provides powerful capabilities for full-text search, structured queries, dashboards, anomaly detection, and machine learning-driven insights, making it suitable for applications such as log management, security analytics, e-commerce search, and data exploration.

FlexiDB – OpenSearch

Yntraa Cloud provides OpenSearch as a fully managed service, taking care of cluster provisioning, scaling, patching, monitoring, backups, and upgrades. This enables organizations to leverage OpenSearch's full potential without the operational complexity of managing distributed search clusters, ensuring high availability, performance, and security.

We offer following options of subscription:

- Opensearch Community Edition Plan:** The OpenSearch Community Edition Plan provides fully managed open-source OpenSearch database, Includes cluster provisioning, lifecycle management, monitoring, backup,updates, and support. Ideal for organizations that want the flexibility of open-source OpenSearch with the reliability of managed infrastructure and support. It is best for small or medium-sized workloads.

For more information, please visit:

Official Website	https://opensearch.org/
For Datasheet	-
For Documentation	https://docs.opensearch.org/docs/latest/
For detailed PSS (Product Specification Sheet)	Refer in Athena

9. Yntraa Cloud® Managed Databases as a service for Elasticsearch

Elasticsearch is a distributed search and analytics engine, built on Apache Lucene, known for its speed, scalability, and relevance. It powers use cases like full-text search, log and event analytics, application monitoring, fraud detection, and real-time data exploration. With features such as distributed indexing, aggregation, and high-performance query execution, Elasticsearch is a preferred choice for organizations managing large volumes of structured and unstructured data.

FlexiDB – Elasticsearch

Yntraa Cloud offers Elasticsearch as a fully managed service, enabling customers to focus on insights while we handle the cluster deployment, scaling, patching, monitoring, backup, and high availability. Our managed service reduces operational overhead and ensures secure, SLA-backed performance for mission-critical search and analytics workloads.

We offer following options of subscription:

- Elasticsearch Enterprise Edition Plan:** The Elasticsearch Enterprise Edition Plan provides fully managed enterprise Elasticsearch database with advanced capabilities such as role-based access control, machine learning-powered analytics, cross-cluster replication, enhanced observability, and enterprise-grade security. It is ideal for large-scale, compliance-driven, mission-critical workloads.

For detailed PSS (Product Specification Sheet)	Refer in Athena

10. Yntraa Cloud® Managed Databases as a service for Hadoop

Apache Hadoop is a distributed computing framework designed to process and store large-scale datasets across clusters of commodity hardware. It supports batch processing, data warehousing, ETL pipelines, and large-scale analytics, making it ideal for enterprises dealing with big data workloads. Hadoop's ecosystem, including HDFS (Hadoop Distributed File System), YARN, and MapReduce, provides a reliable foundation for scalable, fault-tolerant, and cost-effective data processing.

FlexiDB – Hadoop

Yntraa Cloud provides Hadoop as a fully managed service, simplifying the deployment, scaling, monitoring, and lifecycle management of Hadoop clusters. With our managed service, organizations can focus on data analytics, business insights, and application development, while we handle the infrastructure, patching, backup, and high availability of the Hadoop ecosystem.

We offer following options of subscription:

- Hadoop Community Edition Plan:** The Hadoop Community Edition Plan provides fully managed service open-source edition of Apache Hadoop ecosystem, including provisioning and lifecycle support (HDFS, MapReduce, and YARN). Users rely on community documentation and forums for troubleshooting. Best suited for organizations running batch analytics, ETL pipelines, and data warehousing where infrastructure and operational management are provided by the service.

For more information, please visit:

For Datasheet	-
For Documentation	https://hadoop.apache.org/docs/current/
For detailed PSS (Product Specification Sheet)	Refer in Athena

11. Yntraa Cloud® Managed Databases as a service for ScyllaDB.

ScyllaDB is a high-performance, distributed NoSQL database designed for real-time big data workloads. It is fully compatible with Apache Cassandra and DynamoDB APIs but delivers significantly better performance and lower latencies. Built in C++ instead of Java, ScyllaDB offers automatic sharding, optimized resource utilization, and low-p99 latencies, making it ideal for modern, data-intensive applications.

FlexiDB – ScyllaDB

Yntraa Cloud provides ScyllaDB as a fully managed database service offered, enabling organizations to deploy real-time data applications at scale without operational complexity. It simplifies deployment, scaling, monitoring, and lifecycle operations. By offloading infrastructure management, patching, and backups, the service allows organizations to focus on building and running modern, real-time applications.

We offer following options of subscription:

- ScyllaDB Enterprise Edition Plan:** ScyllaDB Enterprise Edition Plan provides fully managed, the enterprise ScyllaDB database. It includes advanced features such as workload prioritization, incremental compaction strategies, monitoring, and advance security. It is best for mission-critical use cases across telecom, finance, gaming and IoT where real-time performance and continuous availability are essential.

For detailed PSS (Product Specification Sheet)	Refer in Athena

12. Yntraa Cloud® Managed Databases as a service for Couchbase.

Couchbase is a high-performance, distributed NoSQL database that combines the flexibility of JSON document storage with the power of SQL-like querying. It is designed for modern applications that demand scalability, high availability, and real-time responsiveness. Couchbase excels in use cases such as customer experience platforms, content management, IoT, and mobile applications.

FlexiDB-Couchbase

Yntraa Cloud provides Couchbase as a fully managed service with eliminating the operational complexity such as provisioning, patching, scaling, monitoring, and backups. Also ensuring seamless performance, reliability, and scale for business-critical workloads.

We offer following options of subscription:

- **Couchbase Community Edition Plan:** The Couchbase Community Edition Plan provides access to the open-source version of Couchbase with core document storage, indexing, and query capabilities. It is suitable for developers, testing environments, and small-scale applications that can operate with standard features and basic support.
- **Couchbase Enterprise Edition Plan:** The Couchbase Enterprise Edition Plan offers a production-ready Couchbase enterprise database with advanced features such as cross-datacenter replication (XDCR), stronger security controls, automated performance optimization, and full high-availability support. It is ideal for large-scale, mission-critical deployments requiring consistent performance and global scalability.

12. Explore More with Yntraa Cloud

Yntraa Cloud is India's leading hyperscale cloud platform, delivering secure, scalable, and high-performance infrastructure and platform services. With a wide portfolio ranging from Compute, Storage, Networking, AI/ML, Security, Database-as-a-Service (DBaaS), and many more. Yntraa Cloud empowers enterprises to accelerate digital transformation while ensuring cost efficiency and compliance.

SutraDB (Relational Database) and FlexiDB (Non-Relational Database) are just one part of our broader cloud ecosystem designed to simplify complex IT needs. Whether you are modernizing applications, scaling workloads, or building next-gen digital platforms, Yntraa Cloud offers the flexibility and reliability you need.
