13. About Yntraa Cloud 31

1. Cloud Assure

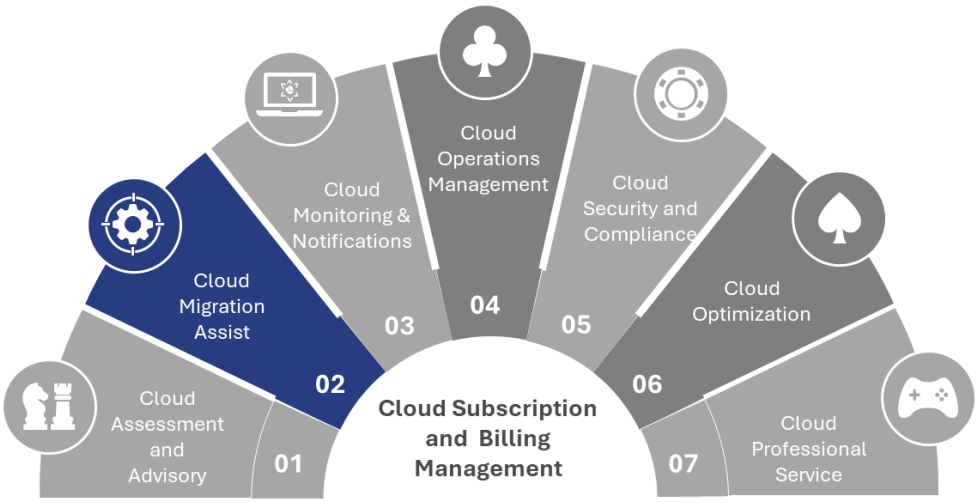
Digital transformation is reshaping the way we live and work. Cloud computing is one of the key technologies enabling this transformation by providing scalable, flexible, and cost-effective IT resources. Organizations adopt the cloud through two main approaches: modernization, which involves redesigning applications to take full advantage of cloud-native capabilities, and migration, which involves moving existing systems and workloads to the cloud with minimal changes.

Modernization and migration in cloud adoption are typically initiated by factors such as:

- Aging or end-of-life infrastructure – Legacy hardware and software reaching obsolescence, driving the need for replacement.
- Escalating operational costs – Rising expenses for on-premises maintenance, licensing, and energy consumption.
- Scalability and growth requirements – Demand for rapid scaling without substantial capital investment.
- Innovation enablement – The need to leverage emerging technologies such as AI, advanced analytics, and IoT.
- Workforce transformation – Supporting remote and hybrid work environments through accessible, cloud-based systems.
- Enhanced security and compliance – Meeting evolving security standards and regulatory mandates.
- Performance optimization – Addressing speed, availability, and reliability limitations in existing systems.
- Organizational change – Integrating or separating IT environments due to mergers, acquisitions, or divestitures.

Cloud Assure is our comprehensive cloud management offering, built on seven distinct service pillars that collectively support every phase of the cloud journey—from initial assessment and migration to ongoing operations, optimization, compliance, and continuous improvement.

This document focuses on the second pillar, Cloud Migration, which encompasses the strategic planning, execution, and validation required to transition workloads, applications, and data from on-premises or legacy systems to the cloud.



2. Cloud Migration Service

Cloud Migration Assist offers a structured and secure way to move cloud assets, including data, applications, databases, infrastructure, and platforms from on-premises or legacy environments to cloud or hybrid destinations.

This service supports a wide range of migration approaches, such as lift-and-shift (rehosting), re-platforming, and refactoring, based on the complexity and goals of your business. It also enables both online and offline migration methods, using industry-standard tools and secure data transfer mechanisms.

From initial discovery and planning to execution and validation, the service ensures minimal disruption to operations, maintains compatibility and compliance, and helps you realize the full benefits of cloud adoption. Whether migrating a few workloads or an entire environment, the approach is tailored to reduce risk and accelerate time-to-value. We ensure a seamless migration experience with minimal operational impact, delivering business continuity throughout the transition. Below are the various types of cloud migrations we support:

- Cloud or Infrastructure Migration
- Application Migration
- Lift and Shift
- Data Migration
    - Offline Data Movement with the customer's Owned Device
    - Offline Data Movement with Provider Device
    - Online Data Movement
    - Online Data Transfer with Data Mover
- Database Migration
    - Database Migration across Homogeneous DB
    - Database Migration across Heterogeneous DB
- Platform Migration
- Data Centre Migration

ACCELERATE YOUR CLOUD JOURNEY WITH CONFIDENCE

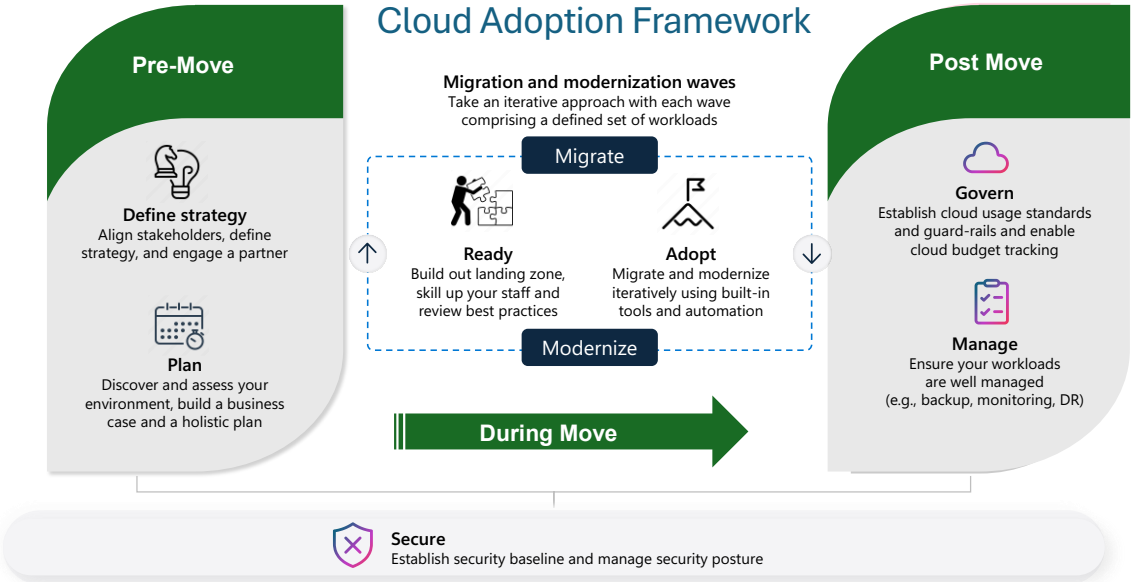
Designed to minimize business disruption, the service supports enterprise transformation with greater agility, compliance, and scalability. To ensure each migration aligns with your unique environment and goals, we offer multiple migration strategies, each tailored to suit different workload types, complexity levels, and modernization needs.

Six Common Migration Strategies:

- Rehost (Lift-and-Shift) – Move applications to the cloud without code or architecture changes; fast, low-risk, cost-efficient.
- Re-platform – Upgrade infrastructure or components while keeping core architecture intact; improves compliance, performance, and cost.
- Repurchase – Replace with a new product or SaaS solution when legacy systems are obsolete, or replacement is more economical.
- Refactor – Redesign and recode to leverage cloud-native capabilities; high complexity and cost, but maximum agility.
- Retain – Keep workloads on existing platforms for regulatory, technical, or strategic reasons; defer or retain permanently.
- Retire – Decommission unused applications to cut costs and reduce technical debt; archive required data securely.

3. Our Approach

Cloud Migration Assist aligns with the Cloud Adoption Framework by supporting the "**During Move**" phase**,** which focuses on the actual migration and modernization of workloads. While the Pre-Move activities (Define Strategy and Plan) are handled under Cloud Assessment & Advisory, Migration Assist is purpose-built to execute the migration strategy with precision, security, and minimal disruption.



In the Move phase of cloud adoption, our approach emphasizes smooth, secure, and structured migration execution through well-defined migration and modernization waves. These waves are not rushed transitions but carefully curated cycles, each built around a specific group of workloads, migrated iteratively to minimize risk and maximize control. We focus on two key stages during this phase: Ready and Adopt.

Ready

Before starting a cloud migration program, in the case of hyperscaler's it's best to perform a Cloud Maturity Assessment as we move ahead in the ready stage. This will give you a clear view of your organization's cloud adoption vision and an honest evaluation of your current capabilities. With this insight, you can identify the most suitable migration approach for each workload.

The Ready stage lays the technical and operational foundation for a seamless migration. Before any workloads are moved, we help organizations establish a robust cloud landing zone tailored to their governance, compliance, and security needs. This includes setting up core cloud infrastructure components such as networking, identity and access management, security baselines, monitoring tools, and automation pipelines.

In parallel, we focus on organizational readiness, ensuring that your teams are equipped with the right skills, training, and access to support the cloud environment. Best practices are reviewed and reinforced, and any gaps in tooling or policy are addressed. We also finalize wave definitions, align stakeholders, and solidify the success metrics that will guide the adoption journey. By the end of this stage, your organization is technically and operationally prepared to begin live migrations with confidence.

Adopt

The Adopt stage is where actual migration and modernization begin. Leveraging the structure and clarity established in the Ready stage, we execute workload migrations using a combination of automation tools, cloud-native services, and proven frameworks. Our approach supports multiple migration strategies—such as lift-and-shift (rehost), re-platforming, or selective modernization—depending on what's best suited for each workload.

Description	Tactical	Strategic	Transformational
Approach	Lift and Shift Rehost	Move or improve Re-platform	Transform Refactor
Business Objective	Optimize costs; minimize IT disruption; achieve a scalable, secure platform	Maximize business value; optimize IT operations	IT as a center of business innovation
Effort	Low	Medium	High

The path you take for each of your applications will differ depending on your overall strategy for cloud adoption, as well as the characteristics of the application that you are trying to migrate. You can aim to become cloud-native or simply lift-and-shift workloads, based on their desired maturity state.

Automation plays a critical role here, accelerating deployment, reducing errors, and allowing for quick rollback if needed. We monitor performance, validate functionality post-migration, and ensure workloads are optimized for their new environment. For workloads selected for modernization, we apply architectural improvements to enhance scalability, resilience, and cost-efficiency.

Throughout this stage, our goal is to ensure migrations occur with minimal disruption to business operations, while laying the groundwork for long-term cloud-native success.

4. Service Objectives

Migration Assist is designed to go beyond technical workload movement by delivering tangible business value

- Accelerated Time-to-Value: Structured migration and automation speed up transitions without compromising security or compliance.
- Operational Continuity: Planned cutovers minimize downtime, ensuring critical business services remain available during migration.
- Cost Efficiency: Leveraging automation, optimal cloud-native services, and right-sizing reduces operational costs post-migration.
- Technology Modernization: Migration is aligned with modernization initiatives such as re-platforming, containerization, and PaaS adoption.
- Compliance & Governance Assurance: All migration activities adhere to governance frameworks, security baselines, and applicable compliance mandates.
- Downtime & Data Synchronization Objectives: While zero downtime is not always feasible in migration scenarios, clear downtime and sync objectives are defined during planning:
- Planned Downtime Window: The acceptable period for cutover activities, defined in

coordination with business stakeholders to minimize impact.

- Data Synchronization Approach: Where possible, migration uses near-real-time replication, asynchronous Approach, or staged sync to ensure data currency at cutover.

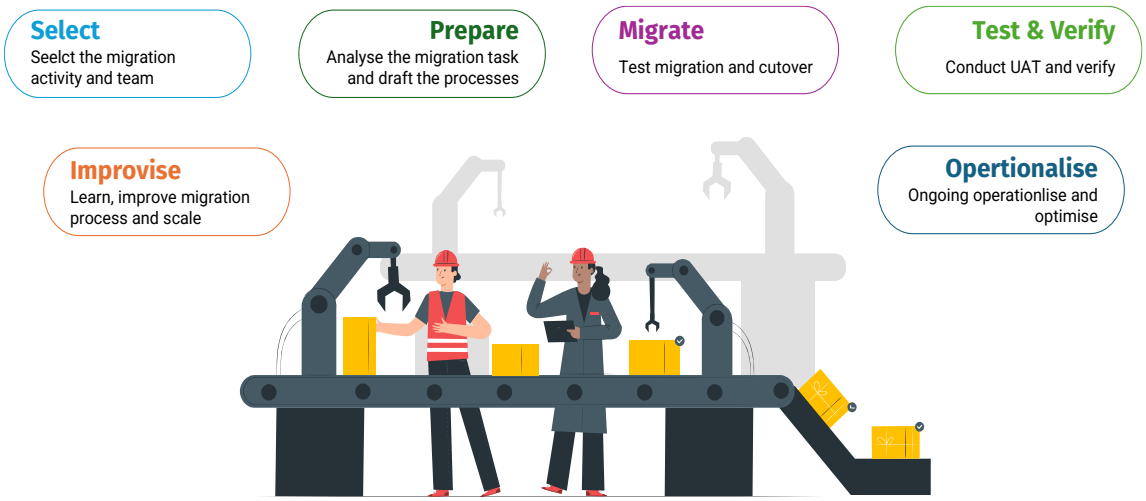
These objectives help guide migration sequencing, tool selection, and cutover strategy to ensure business priorities are met.

5. Migration Factory

The migration factory model addresses the complexities of large-scale migration initiatives by providing a proven, scalable framework aligned with the Yntraa Cloud Adoption Framework. It enables organizations to:

- Rapidly migrate and manage large volumes of systems and applications with consistent quality and minimal business disruption.
- Embed cloud-native practices, including automated deployment and DevOps.
- Foster a collaborative operating model between IT and business stakeholders.
- Beyond delivering migrations, the migration factory establishes a sustainable capability that:
- Accelerate value realization through faster workload transition.
- Maintains governance and compliance via standardized processes and automated controls.
- Drive continuous improvement through iterative learning.
- Supports enterprise-wide transformation by aligning technology adoption with cultural change.

This approach transforms migration from a one-time project into a repeatable, strategic function that ensures workloads are transitioned, modernized, and managed efficiently at scale



Migration Factory

The factory is composed of parallel execution lines (or migration pods), each following a clearly defined progression from assessment to release with embedded governance, QA, and security throughout.

Table 1: Migration Factory Phases

1. Assessment and Planning	- Inventory workloads, infrastructure, and dependencies - Establish performance baselines - Identify risks and compliance needs - Define migration strategy and timeline - Select migration tooling and automation methods
2. Prepare and Schedule	- Batch grouping of workloads by complexity and priority - Define rollback strategy and communication plans - Finalize migration waves and scheduling - Issue/Risk identification and mitigation planning
3. Rehost / Refactor	- Configure cloud environment and network - Execute VM replication and database migration - Perform rehosting, re-platforming, or containerization - Upgrade application components as needed
4. Validation Test	- Functional testing, integration validation, and performance benchmarking - Service accessibility checks and user acceptance testing (UAT) - Track and fix defects, if any, prior to final deployment
5. Release / Deploy	- Execute final cutover with CI/CD pipeline - Configure container environments, registries - Documentation, runbooks, and readiness handoff

6. Migration Types

Cloud migration is not a one-size-fits-all journey. The choice of migration type depends on several factors, including existing infrastructure, workload complexity, business priorities, compliance needs, and modernization goals. Yntraa Cloud classifies migration efforts into distinct types to help organizations align the right methodology with the desired outcomes, ensuring a smooth, secure, and value-driven transition to the cloud. The following standardized strategies are adopted to guide and execute migration based on business and technical priorities.

6.1 Cloud or Infrastructure Migration

Cloud or Infrastructure Migration is the process of moving digital assets, including compute resources, applications, databases, and systems, from on-premises data centers, private hosting environments, or other cloud platforms to a target cloud environment. This may include Public, Private, Hybrid, or Multi-Cloud configurations.

Common Cloud Migration Scenarios

Scenario	Source	Destination
On-Premises to Public Cloud	On-premises data centers	Yntraa Cloud, AWS, Azure
On-Premises to Private Cloud	On-premises data centers	VMware Cloud, OpenStack, HPE Green Lake
On-Premises to Hybrid Cloud	On-premises + legacy infrastructure	Azure Stack, AWS Outposts
Private Cloud to Public Cloud	VMware vSphere, OpenStack, Nutanix	AWS (VMware Cloud on AWS), Azure (AVS), (Migrate for Compute Engine)
Cloud-to-Cloud Migration	AWS, Azure	Another cloud provider (e.g., Azure to AWS)
Public Cloud to Private Cloud	AWS, Azure	On-prem VMware/OpenStack, sovereign or isolated cloud instances
Legacy Infrastructure Upgrade	Bare-metal servers, mainframes	Cloud-native or containerized environments (Kubernetes, serverless)
Cross-Region Migration	Cloud resources in one region	Same cloud in a different region (e.g., AWS Singapore to AWS Mumbai)
Hybrid to multi-cloud	Partial cloud + On-prem	Combination of multiple public clouds and on-prem (e.g., AWS + Azure + DC)

In cases where customer requirements or cloud environments vary from the above scenarios, the migration approach will be tailored accordingly. A detailed scope of work will be defined and documented based on the specific needs. The finalized migration plan will be shared with the customer for review and sign-off. Please note, charges may vary based on the extent of customization, complexity, and additional effort involved.

Responsibility Matrix

Area	Service Provider	Customer
Migration Strategy	R, C	A
Cloud Landing Zone Setup	R, A	C
Compliance & Regulatory Readiness	C	R, A
Workload Testing and Validation	R	A, C
Cutover Planning and Execution	R	A, C
Cost Optimization Post-Migration	R	A, C

Our Approach

Assessment	•Inventory infrastructure, applications, and dependencies. •Identify critical workloads, processes, and data flows. •Evaluate cloud readiness using tools (e.g., Carbonite, AWS CART, Azure Migrate etc). •Conduct cost-benefit and TCO analysis. •Assess compliance, data sovereignty, and performance constraints.
Startegy	•Align migration approach with business goals, risk tolerance, and transformation targets. •Define business drivers (agility, scalability, cost savings, innovation). •Select cloud deployment model: Public, Private, Hybrid, or Multi-Cloud. •Choose workload migration patterns. •Draft a high-level target cloud architecture.
Planning	•Create an actionable migration plan with clear priorities and timelines. •Group workloads into migration waves by complexity and dependencies. •Establish change management and communication frameworks. •Integrate security, networking, IAM, and compliance into design. •Define milestones, KPIs, and rollback procedures. •Confirm stakeholder alignment and resource availability.
Selection of Tools	•Choose cloud provider(s) (AWS, Azure, etc.). •Select migration tools (AWS Migration Hub, Azure Migrate, third-party solutions). •Identify supporting tools for database, VM, storage, and container migration. •Validate licensing models and integration compatibility.
Migration Execution	• Set up landing zone and target cloud environment. • Start with a pilot migration for validation. • Execute in waves or single cutover based on business needs. • Verify performance, compatibility, and data integrity post-migration. • Troubleshoot and optimize migration runbooks.

6.2 Application Migration

This service enables the secure and efficient migration of business applications from on-premises data centers or legacy platforms to modern cloud environments or between cloud providers. It encompasses assessment, planning, and execution tailored to the unique architecture and dependencies of each application. With a focus on minimal disruption, performance optimization, and compliance, the service supports various migration strategies, including rehosting, re-platforming, and refactoring, ensuring applications are fully operational and integrated in the target environment. Our approach for application migration is illustrated below;

1. Assessment & Discovery

- Inventory & Classification: Identify all applications in scope, including dependencies, integrations, and criticality.
- Suitability Analysis: Evaluate application compatibility with target environments (cloud-readiness, licensing, OS, architecture).
- Migration Strategy Mapping: Classify applications using the 6 R's framework: Rehost, Re-platform, Refactor, Repurchase, Retire, or Retain.

2. Planning & Design

- Target Environment Definition: Select destination platform (IaaS, PaaS, container, SaaS) based on application type and business goals.
- Architecture Review: Evaluate network, security, identity, and data storage requirements in the target environment.
- Wave Planning: Group applications into migration waves based on complexity, business impact, and interdependencies.

3. Preparation & Readiness

- Prepare necessary environments (cloud VMs, containers, service endpoints).
- Define cutover plans, rollback strategies, and backup mechanisms.
- Ensure development, QA, and staging environments mirror production setup for pre-migration validation.

4. Migration Execution

- Perform application packaging or image capture (if applicable).
- Migrate the application workload using the selected method (e.g., rehosting, containerization, or rebuilding).
- Implement configuration changes, connectors, and third-party integrations in the new environment.
- Validate data integrity, connectivity, and functionality in the new setup.

5. Testing & Cutover

- Execute detailed functional, integration, and performance testing.
- Involve business users for user acceptance testing (UAT).
- Perform final cutover, DNS routing changes, and legacy environment switchover.

6. Post-Migration Optimization

- Monitor application behavior, performance, and cost.
- Enable auto-scaling, CI/CD pipelines, logging, and security policies.
- Implement performance tuning and conduct a post-mortem review for continuous improvement.
- Customer Responsibilities and Shared Scope

Responsibility Matrix

Activity	Customer	Service Provider
Application discovery & dependency mapping	C	R, A
Cloud readiness and risk assessment	A	R
Migration path definition (6 R's model)	A	R
Target environment architecture design	C	R, A
Test planning and validation execution	A, C	R
Performance benchmarking	C	R, A
Rollback and recovery planning	C	R, A
Knowledge transfer and documentation	C	R, A
Go-live and post-migration support	A	R

In case of non-standard requirements or environments, the migration approach will be tailored accordingly. A detailed scope of work will be documented and shared for customer review and sign-off. Charges may vary based on customization, complexity, and additional effort involved.

6.3 Lift and Shift Migration

This method involves using a secure, high-capacity physical device provided by the cloud service provider to transfer large volumes of data from the customer's premises to the cloud. The device is shipped to the customer, who loads the data onto it. Once complete, the device is returned to the provider, who uploads the data into the designated cloud storage or database environment.

Our approach to Lift and Shift Migration is phased and methodical, designed to reduce risk, ensure system integrity, and accelerate time-to-cloud:

1. **Discovery & Assessment**
   - Inventory applications, workloads, and dependencies
   - Identify systems suitable for lift and shift based on stability, architecture, and performance
   - Assess licensing, OS compatibility, security, and support requirements
2. **Planning & Readiness**
   - Define target cloud or infrastructure environment (VMs, storage, networking)
   - Determine downtime tolerance and business impact
   - Align migration waves with business priorities and maintenance windows
3. **Design & Preparation**
   - Create target environment templates (e.g., compute instance types, storage classes, networks)
   - Define replication, backup, or image-based migration methods
   - Validate security controls, IAM roles, and monitoring configurations
4. **Execution & Migration**
   - Perform VM image replication, backup/restore, or snapshot-based transfers
   - Validate connectivity, access controls, and application responsiveness
   - Conduct functional and performance testing post-migration
5. **Cutover & Optimization**
   - Coordinate final cutover with rollback plan in place
   - Decommission or archive source systems
   - Optional post-migration tuning (e.g., right-sizing, auto-scaling, backup schedules)

Responsibility Matrix

Activity	Customer	Service Provider
Application & Infrastructure Discovery	C	R, A
Dependency Mapping & Risk Assessment	A, C	R
Migration Planning & Wave Design	A, C	R
Network & Security Configuration	C	R, A
Replication & Data Transfer Setup	I	R, A
Testing & Validation	A, C	R
Final Cutover & Rollback Planning	A, C	R
Documentation & Knowledge Transfer	C	R, A
Decommissioning of Legacy Systems	C, A	R, I

In case of non-standard requirements or environments, the migration approach will be tailored accordingly. A detailed scope of work will be documented and shared for customer review and sign-off. Charges may vary based on customization, complexity, and additional effort involved.

6.4 Data Migration

Data Migration, also referred to as Data Movement, Data Transfer, or Data Import/Export, is the process of transferring data between storage types, formats, systems, or applications. It often occurs during infrastructure upgrades, system replacements, or transitions to new platforms such as cloud environments. This process is critical for ensuring data consistency, integrity, and availability in the new environment. Whether it's part of a digital transformation, application modernization, or hardware refresh, data migration must be executed with precision to avoid loss, corruption, or disruption. A well-planned approach includes data profiling, cleansing, mapping, transformation, validation, and testing to ensure business continuity and compliance.

Major components need to be considered for data movement or migration.

- Type of data (Unstructured/ structured/ critical/ non-critical/ digital / non-digital)
- Amount of data (Data Size)
- Time frame required.
- Transfer frequency - One-time or scheduled data ingestion.
- Network / Connectivity – Bandwidth available for data transfer in your environment.
- Data source: The source of the data being moved, such as databases, file servers, or cloud storage.
- Transfer method - Network file transfer, data backup, or cloud migration.
- Security - Ensuring the data's confidentiality, integrity, and availability during and after the transfer.
- Target environment - The destination for the data, such as a new storage system, database, or cloud platform.
- Data quality - Ensuring that the data being moved is accurate and consistent, and addressing any issues before the migration.

a. Offline Data Movement with the customer's Owned Device

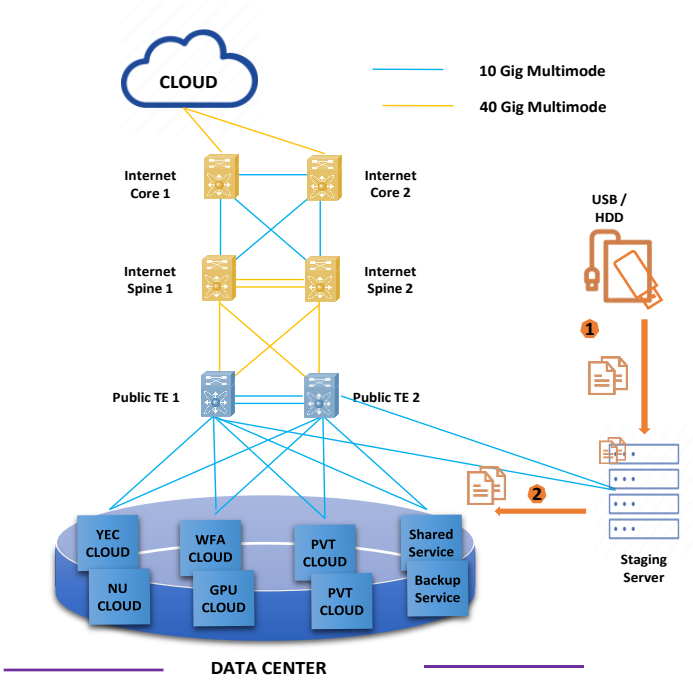
In this method, the customer exports their data to a physical device they own (such as a hard disk or storage appliance) and ships it to the target cloud environment for manual ingestion, where the target cloud environment is Yntraa Cloud. This is ideal when internet connectivity is constrained or security mandates using private devices.

When to consider:

- If available network bandwidth is limited or non-existent, and you want to transfer large datasets.
- This option is the best choice for a LAN Environment.
- Security or organizational policies do not allow outbound connections or deal with sensitive data.
- This solution is effective and mostly adopted by customers when the data size is less than or equal to (~ 10TB).

Steps of the process followed for OFFLINE DATA TRANSFER

- Customer requests data copies or transfer through an account manager and raises a service order, as well as gets the signed SOF (Service Order form).
- Service details and applicable charges will be signed off by the customer.
- The assigned Project Manager coordinates with the customer for confirmation.
- Yotta personnel take the movable disk from the customer and connect it to the staging server after necessary scanning and security checks.
- Yotta representative will assist and allow the copying of data from this server to the designated customer server as desired. This is optional and will be charged separately.
- Customer has a choice to do these activities by himself (do it yourself).
- Anything other than the above-defined scope needs to be agreed upon, and the same will be charged extra.



Customers' Responsibilities

a) The Customer will hand over the moveable disk to Yotta authorized personnel @ Yotta DC.
b) Customer will initiate the initiation of data transfer or copy to its respective server/setup.

Note:

- *For any support or assistance, please contact the Helpdesk.*
- *Performance may vary and depend upon the availability of computing and network capacity.*
- *While we take every precaution to ensure the security of your data, we cannot be held liable for any data loss or any mishaps. We request that you maintain a backup copy of your important information before this activity as well as to mitigate potential risks.*
- *Further, other terms and conditions are governed by SOF and MSA.*

Why to Select?

- Quick process and easy to go.
- Controlled and secured too.
- Security: Transferring data through personal devices eliminates the risk of data breaches that can occur while transmitting over public networks.
- Speed: Direct transfer between devices can be faster than uploading and downloading from the internet.
- Convenience: No connectivity is required, enabling data transfer anytime, anywhere.
- Cost-effective: No need for internet or data charges for transferring data.
- Large file transfer: Can transfer large files that may not be easily transferable through online file-sharing platforms.

b. Offline Data Movement with Provider Device

This method involves using a secure, high-capacity physical device provided by the cloud service provider to transfer large volumes of data from the customer's premises to the cloud. The device is shipped to the customer, who loads the data onto it. Once complete, the device is returned to the provider, who uploads the data into the designated cloud storage or database environment. This method is currently available through Yntraa Cloud, AWS, and Azure. For e.g., AWS provides Snowball and Snowmobile devices for large-scale offline data transfer, Azure offers the Data Box family (Data Box, Data Box Disk, and Data Box Heavy), and Yntraa Cloud provides its own high-capacity secure transfer appliance for moving bulk datasets into the cloud.

When to Consider?

- **Mass Data Migration:** Terabytes to petabytes of data requiring one-time bulk transfer.
- **Bandwidth Limitations:** Situations where available network bandwidth makes online transfer slow or infeasible.
- **Time-Sensitive Moves:** When faster data ingestion is required compared to long-duration network transfers.

- **Remote / Disconnected Locations:** Environments with unreliable internet connectivity.
- **Seeding Cloud Storage:** Initial bulk load of data into cloud before switching to incremental online synchronization.

Steps to Follow

1. **Request & Delivery:** Order the device from the cloud provider (AWS Snowball, Azure Data Box).
2. **Device Setup:** Connect the device on-premises, install client software, and authenticate.
3. **Data Loading:** Transfer the required datasets onto the device using the provided secure interface.
4. **Encryption:** Data is automatically encrypted (typically AES-256) during transfer.
5. **Return Shipping:** Ship the device back to the provider using secure logistics.
6. **Cloud Ingestion:** Provider uploads the data into the specified cloud storage or database service.
7. **Verification:** Validate data integrity and confirm successful ingestion into the cloud.

Note:

- For any support or assistance, please reach out to the Support Desk.
- Actual transfer speed and timelines may vary depending on local infrastructure, data size, and device capacity.
- Although devices are encrypted and secured, we recommend maintaining a **separate backup** of critical data before initiating transfer. We cannot be held liable for any data loss or incidents during shipment, loading, or ingestion.
- Shipping schedules are dependent on courier and logistics partners, which may affect delivery timelines.
- Device usage charges, shipping costs, and data ingestion fees are governed by the respective cloud provider's pricing model.
- Other terms and conditions will follow the applicable Statement of Work (SoW), Service Order Form (SOF), and Master Service Agreement (MSA).

c. Online Data Movement

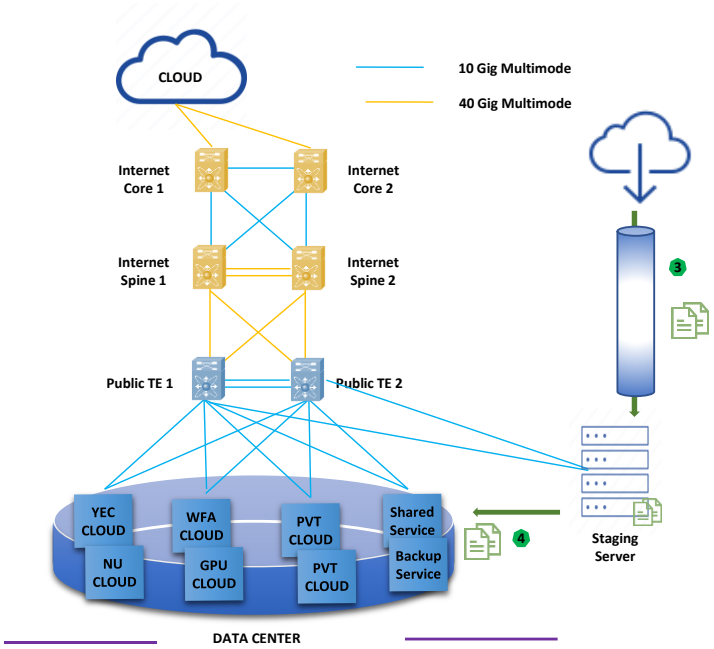
Online migration uses network-based tools and services to directly transfer data from source to target in real time or near-real time over the internet or private networks. It enables continuous data replication, often used in lift-and-shift or phased migration scenarios.

When to consider?

- If network bandwidth is available, and you want to transfer large datasets.
- Security or organizational policies do not allow physical movement or any use of a moveable disk for sensitive data copy or movement.

- Depending upon the data size, the bandwidth requirement, as well as the time to copy, will vary.

Time taken for complete data copy might take longer compared to the earlier mechanism.



Steps of the process followed for ONLINE DATA TRANSFER

- Customer requests data copies or transfer through an account manager and raises a service order under SOF.
- Charges are as applicable and will be signed off by the customer.
- SDM will raise the IR task and facilitate the rights and allow necessary access along with the OPS team. After the success of the IR task and confirmation from the customer. Customer checks and closure of service happen.
- Further data transfer type varies as per customer choice.
  a. Option I- Data transfer over the public network will communicate between the customer server and the staging server on a secure VPN tunnel.
  b. Option II- Data transfer over a private network, using Yotta's private connectivity to communicate with the customer server through the staging server.
- Customer has a choice to do these activities by himself (do it yourself).
- Anything other than the above-defined scope needs to be agreed and the same will be charged extra.
- Customers Responsibilities
  a. Connectivity is the customer's responsibility and needs to subscribe to or provide.
  b. Secure VPN tunnel
  c. Customer will initiate the initiation of data transfer or copy to the respective server/setup.

Note:

- *For any support or assistance, please contact the Support desk.*
- *Performance may vary due to the compute and the network.*
- *While we take every precaution to ensure the security of your data, we cannot be held liable for any data loss or any mishaps. We request that you maintain a backup copy of your important information before this activity, as well as to mitigate potential risks.*
- *Further, other terms and conditions are governed by SOF and MSA.*

Note:
It is important to note that data transfer time is directly dependent on the available network bandwidth. As one of the key parameters in online data copy management, network bandwidth plays a decisive role in determining the efficiency and duration of transfers. The Service Provider leverages its expertise to optimize transfer strategies within the given bandwidth constraints, ensuring predictable timelines and minimal disruption. The table below illustrates an estimation of the time required for data transfer (This could change as per overheads, retransmission attempts, network/bandwidth utilisation, sudden data bursts, etc.).

Time Estimation Table

Data Size	10Mbps	50Mbps	100Mbps	500Mbps	1Gbps	10Gbps
100 GB	24 Hrs	4.7 Hrs	2.4 Hrs	0.5 Hrs	0.25 Hrs	0.03 Hrs
1 TB	240 Hrs	48 Hrs	24 Hrs	5 Hrs	2.4 Hrs	0.25 Hrs
5 TB	1224 Hrs	240 Hrs	122.4 Hrs	24 Hrs	12 Hrs	1.2 Hrs
10 TB	2472 Hrs	480 Hrs	240 Hrs	50.4 Hrs	24 Hrs	2.4 Hrs
50 TB	12336 Hrs	2424 Hrs	1224 Hrs	240 Hrs	120 Hrs	12 Hrs
100 TB	24672 Hrs	4848 Hrs	2472 Hrs	504 Hrs	240 Hrs	24 Hrs
1 PB	246720 Hrs	48480 Hrs	24720 Hrs	5040 Hrs	2400 Hrs	240Hrs

d. Online Data Transfer with Data Mover

This is an enhanced form of online data transfer where a dedicated "data mover" software or service manages the end-to-end movement, transformation, and validation of data. Data Mover can be any specialized tool that can be utilized for the Migration of Data from the Source to the destination. Data movers may include built-in logic for retry, deduplication, integrity checks, and performance optimization.

When to Consider

- **Continuous or Incremental Transfers:** Suitable for ongoing synchronization of large datasets or frequent updates.
- **Data Validation Needs:** When integrity checks, logging, and verification are critical.
- **High Volume Online Migration:** Efficient for terabyte-scale transfers when network capacity is sufficient.

- **Hybrid/Edge Workflows:** Moving data from edge or on-prem systems to cloud storage with performance tuning.
- **Migration with Transformation:** When pre-ingestion processing (compression, deduplication, encryption) is required.

Steps to Follow

1. **Provisioning:** Deploy or configure the data mover software/service (cloud-native or third-party).
2. **Configuration:** Define source datasets, target cloud storage, and transfer rules (scheduling, filters, encryption).
3. **Optimization Setup:** Enable built-in features such as compression, deduplication, and bandwidth throttling.
4. **Data Transfer Execution:** Data mover securely transfers files/objects to the cloud with retries and error handling.
5. **Validation & Integrity Checks:** Automated checksum comparisons and transfer validation.
6. **Reporting:** Generate logs, transfer summaries, and performance reports for auditing.

Notes

- For support or assistance, please contact the Support Desk.
- Transfer performance depends on available bandwidth, network stability, and configuration of the data mover.
- It is recommended to **test pilot transfers** before large-scale execution to validate throughput and integrity.
- Licensing costs may apply for third-party or enterprise-grade data mover tools.
- Ensure compliance with security policies (encryption, access control) during data movement.
- Other terms and conditions are governed by the applicable Statement of Work (SoW), Service Order Form (SOF), and Master Service Agreement (MSA).
- **Responsibility Matrix**

Activity	Customer	Service Provider
Data discovery and scoping	C	R, A
Migration planning and scheduling	A, C	R
Selection of an appropriate transfer method	A, C	R
Pre-transfer data validation	A, C	R
Network and security configuration	C	R, A
Encryption, compression, and format review	C	R, A
Device sanitization (offline methods)	R, A *(own device)*	R, A *(provider device)*
Monitoring and status tracking	C	R, A
Post-migration verification and sign-off	A	R

In case of non-standard requirements or environments, the migration approach will be tailored accordingly. A detailed scope of work will be documented and shared for customer review and sign-off. Charges may vary based on customization, complexity, and additional effort involved.

6.5 Database Migration

Database Migration is the process of transferring data from one database environment to another, whether between servers, storage systems, platforms, or cloud environments, with minimal disruption and zero data loss. This move is often part of broader cloud adoption or modernization initiatives and requires a strategic approach to preserve data integrity, performance, and security. With a standardized, end-to-end migration methodology, we ensure seamless transitions through every phase: assessment, schema conversion, data replication, testing, and cutover. Our agile frameworks, automation tools, and collaborative engagement model accelerate the process while aligning with your business priorities. From planning to execution and post-migration validation, we ensure your database transformation is smooth, efficient, and future-ready.

Database Migration across Homogeneous and Heterogeneous DB

While the underlying technologies differ, both homogeneous and heterogeneous database migrations follow the same fundamental process—from assessment and data profiling to transformation, validation, and loading.

1. **Pre-Migration Planning and Assessment**
   This phase lays the foundation for the entire migration process. It includes:

   a. Readiness & Source System Analysis
   - Understand the business purpose of the migration (e.g., performance, consolidation, modernization).
   - Identify all source systems and data repositories involved.
   - Determine if the migration is full or partial.
   - Analyze data quality dimensions: accuracy, completeness, timeliness, consistency, and validity.
   - Assess data structure and format consistency across source databases.
   - Document current schema, relationships, indexing, stored procedures, triggers, and constraints.

   b. Data Profiling
   Data profiling helps identify potential quality issues and assess whether they are fixable during migration. Typical profiling activities include:
   - Counting unique and blank values.
   - Identifying data ranges and outliers.
   - Verifying data types and patterns (e.g., date formats, phone number syntax).
   - Highlighting duplicate records and orphan entries.

   c. Strategy Selection (Homogeneous vs. Heterogeneous)
   - **Homogeneous Migration** involves the same database engine (e.g., Oracle to Oracle, SQL Server to SQL Server). Schema mapping and transformation needs are minimal.

- **Heterogeneous Migration** involves different database engines (e.g., Oracle to PostgreSQL, SQL Server to MySQL), which requires:
    - Schema conversion and syntax compatibility checks.
    - Custom translation for stored procedures, triggers, and data types.
    - Careful mapping between data models.

2. **Data Mapping and Transformation**
   This phase defines how data elements from the source will align with those in the target database.

   - Perform field-to-field mapping for every table, column, and key.
   - Define transformation rules to resolve formatting differences (e.g., date/time formats, numeric precision).
   - Design mechanisms to merge or split fields, rename attributes, or normalize datasets.
   - Add new fields required by the target database that didn't exist in the source (e.g., classification tags or metadata).
   - Use tools like schema compare utilities or ETL platforms to automate the mapping process when applicable.

3. **Migration Design and Execution**
   With mappings and transformations defined, the migration process is designed for efficiency and accuracy.

   a) **Extraction**
      - Extract data from multiple sources (databases, spreadsheets, flat files).
      - If legacy data is in paper form, digitization using OCR tools may be required.
      - Export to standard, interoperable formats like CSV, JSON, or XML.

   b) **Transformation**
      - Clean and convert data using tools like Open Refine or ETL platforms.
      - Enforce data type conformity and resolve syntax discrepancies.
      - Normalize or de-normalize data as per the target schema.

   c) **Validation and Testing**
      - Validate data against the business rules of the target system:
        - Data type and length constraints
        - Mandatory fields
        - Uniqueness and foreign key constraints
      - Perform sample migrations with subsets of data for quality checks.
      - Conduct user acceptance testing (UAT) and reconciliation reporting between source and target databases.

   d) **Loading**
      - Load data into the target system using bulk import tools, scripts, or database utilities.
      - Use transactional controls or staging tables to manage rollback in case of failure.
      - Ensure minimal downtime with strategies like incremental loads or replication for large-scale systems.

4. **Post-Migration Validation and Cutover**

After loading:

- Perform reconciliation testing to compare record counts, data integrity, and relationships between source and target.
- Ensure indexing, constraints, and stored procedures are correctly deployed in the target system.
- Gather sign-off from stakeholders after verification.
- Decommission or archive the legacy database after a freeze period.
- Remove any temporary data files or intermediate exports to avoid data leaks.

5. **Security and Compliance Considerations**
   - Backup all source systems before any data manipulation.
   - Maintain role-based access control throughout the migration.
   - Ensure data encryption during transfer, especially for sensitive or regulated data.
   - Log all activities for auditability and rollback tracking.
   - Sanitize temporary files and ensure secure deletion after migration.

Responsibility Matrix

Activity	Customer	Service Provider
Pre-migration discovery and planning	A, C	R
Data profiling and validation	A, C	R
Schema and dependency mapping	C, A	R
Cloud database provisioning	I	R, A
Data transformation and migration	I	R, A
Performance tuning post-migration	C	R, A
Application integration testing	A, C	R
Cutover and rollback planning	A, C	R
Post-migration support	A	R, C

In case of non-standard requirements or environments, the migration approach will be tailored accordingly. A detailed scope of work will be documented and shared for customer review and sign-off. Charges may vary based on customization, complexity, and additional effort involved.

For more information related to Database Migration, please refer to Service PSS-Database Service

6.6 Platform Migration

Platform Migration refers to the process of moving applications, workloads, or entire systems from one computing environment or technology stack to another—whether from on-premises to the cloud, between cloud providers, or across different runtime platforms. This migration helps modernize legacy systems, improve application performance, and unlock agility, scalability, and cost-efficiency. It involves re-hosting, re-platforming, or reconfiguring applications to operate optimally in the new target environment without compromising functionality, security, or user experience.

- **Approach**

Platform Discovery & Evaluation

- Assess current hosting environment, application architecture, dependencies, and configurations
- Identify compatibility gaps and business-critical risks

Migration Planning & Strategy

- Define optimal migration paths tailored to the organization's goals, timelines, and security needs
- Prioritize workloads based on impact and complexity

Platform Transition & Execution

- Migrate workloads across a wide range of infrastructure platforms on-premise, cloud, and hybrid
- Support for rehosting, re-platforming, or transformation, depending on application readiness.

Data Integrity & Security Assurance

- Ensure secure data transfer and consistent access controls throughout the transition.
- Minimize downtime through planned cutovers and rollback strategies.

Post-Migration Validation

- Performance benchmarking, service stabilization, and optimization in the target platform.
- Knowledge transfer and handover to internal or managed service teams.

Responsibility Matrix

Activity/Area	Customer	Service Provider
Provide access to existing infra & credentials	R, A	I
Stakeholder nominations and sign-offs	R, A	I
Current infra/app documentation	A, C	R
Migration design and planning	A, C	R
Inventory and dependency mapping	C	R, A
Migration tool and method selection	C	R, A
Backup and recovery preparation	A, C	R
Network and connectivity provisioning	C	R, A
Application functional validation (UAT)	R, A	C
Migration execution	I	R, A
Test plan creation and execution	A, C	R
Post-migration issue resolution	C	R, A
Knowledge transfer and documentation	C	R, A
Final sign-off and acceptance	A	I
Ongoing support post-handover (if applicable)	A, C	R

In case of non-standard requirements or environments, the migration approach will be tailored accordingly. A detailed scope of work will be documented and shared for

customer review and sign-off. Charges may vary based on customization, complexity, and additional effort involved.

6.7 Data Centre Migration

As detailed throughout this document, most aspects of the migration process have been comprehensively covered. Data Center Migration entails the strategic relocation of critical IT assets—including servers, storage systems, networking infrastructure, and applications—from one environment to another, be it physical, virtual, or cloud-based. Often part of broader infrastructure modernization or consolidation initiatives, such migrations require meticulous planning, proactive risk management, and deep technical acumen.

- **Approach**
  Depending on your objectives, risk profile, and downtime tolerance, we recommend one of the following proven migration approaches:

1. **Lift and Shift (Forklift Migration)**
   A traditional method where existing IT infrastructure is backed up, powered down, physically transported to the new location, reinstalled, and brought back online. This approach is simple and cost-effective but involves planned downtime. It is best suited for less critical systems or environments where brief service interruptions are acceptable.
2. **Swing Move**
   This method involves creating a temporary replica of the production environment—known as a swing environment—at the destination data center. Data and applications are replicated continuously to this interim setup, allowing normal operations to continue while the original infrastructure is physically migrated. Once the move is complete, operations are cut over with no interruption. It's a zero-downtime approach but requires significant planning and additional infrastructure.
3. **Logical Move (Virtualized or Cloud-Based Migration)**
   A logical move focuses on virtual or cloud environments where no physical equipment needs to be relocated. Workloads and data are migrated virtually using replication, snapshots, or cloud-native tools. This approach eliminates physical risks and downtime but requires deep technical expertise and often includes reconfiguring systems for the new platform.

Responsibility Matrix

Activity	Customer	Service Provider
Discovery and Inventory Validation	C	R, A
Risk and Impact Assessment	A, C	R
Application Dependency Mapping	C	R, A
Migration Planning and Scheduling	A, C	R
Data Backup and Recovery Readiness	A, C	R
Physical Move Execution	I	R, A
Functional and Performance Testing	A, C	R

Cutover and Rollback Coordination	A, C	R
Final Validation and Sign-Off	A	I

In case of non-standard requirements or environments, the migration approach will be tailored accordingly. A detailed scope of work will be documented and shared for customer review and sign-off. Charges may vary based on customization, complexity, and additional effort involved.

7. Handover Guidelines

Upon successful migration of the agreed infrastructure components to the cloud environment, a formal handover process is initiated. This ensures operational continuity, transparency, and a smooth transition to the customer's internal team or designated support provider.

Key steps include:

1. **Final Validation and Sign-off**
   - Comprehensive testing and validation of migrated infrastructure to ensure functionality, performance, and compliance with the agreed migration objectives.
   - Customer review and formal acceptance of the migrated setup.
2. **Documentation Delivery**

   Delivery of all relevant migration artifacts, including:
   - Updated asset and inventory lists
   - Network and system topology
   - Credentials and access management details (handed over securely)
   - Configuration files, firewall rules, and storage mappings
   - Final state architecture and change log
3. **Knowledge Transfer (KT) Sessions**

   Scheduled KT sessions (remote or on-site) to walk through:
   - Cloud platform usage
   - Infrastructure components and dependencies
   - Maintenance best practices
   - Escalation paths and support procedures
4. **Support Handoff or Transition**
   - If post-migration managed services are not included, the handover concludes the engagement.
   - If managed services are included, the migration enters the operations and monitoring phase under the agreed support model.

8. Service Terms and Conditions

The following terms govern the execution of all Migration Assist engagements unless otherwise agreed in writing:

- All migration activities will be executed strictly as per the mutually agreed scope. Any changes or additions will require a formal change request and may impact cost, schedule, or deliverables.

- Migration timelines, quality benchmarks, and cutover success criteria will be mutually defined during planning. Unless otherwise agreed, no penalties apply for delays arising from customer dependencies, third-party delays, or force majeure.
- Any third-party tools, OEM licenses, or cloud-native services required for assessment, automation, or migration execution are billed separately unless explicitly included in the SOW.
- Timely access to infrastructure, applications, credentials, and SMEs.
- Customer is responsible for application-level changes unless otherwise contracted.

9. Exclusions

Exclusions – Migration services do not include:

- Post-migration application feature enhancements
- Custom development outside the agreed migration scope
- OEM support charges, unless explicitly stated
- Liability for downtime or loss of data

Downtime – While planned cutovers aim to minimize downtime, zero downtime is not guaranteed unless explicitly specified in the Statement of Work (SoW).

Liability – The service provider is not liable for business losses arising from migration downtime or unforeseen technical issues beyond reasonable control.

Data Security – All data transfers will be performed in accordance with the encryption and security policies agreed upon during the planning phase.

Compliance – Adherence to specific compliance standards (e.g., ISO 27001, DPDP Act, GDPR) will be ensured only if stated in the SOW.

Completion Criteria – A migration will be deemed complete once the agreed deliverables have been met and formal customer sign-off is obtained.

10. Service Plans

Product Category	Product Type	Plan Description	UOM
Cloud Assure Service	Migration Assist - Cloud or Infrastructure	**MIGRATION ASSIST – CLOUD OR INFRASTRUCTURE MIGRATION** This service delivers full-scope migration services covering physical, virtual, and cloud-native infrastructures. This service ensures smooth, secure, and scalable movement of compute, storage, networking, and associated resources, either, From on-premises physical to virtual or virtual to virtual or data centres to hosted cloud or private cloud, or public cloud. > Pricing includes effort based on the scope of work, with SOFTWARE, LICENSES, or TOOLS needed to	EA

		support the delivery of the project, and that will be charged extra as applicable.	
Cloud Assure Service	Migration Assist - Application	**MIGRATION ASSIST – APPLICATION** Migrate your legacy applications and cloud-based applications easily with our application migration services. We provide custom application migration services to refactor, modernize, upgrade, and scale business applications effectively. We offer the best app migration services, whether on-premises to cloud, or physical to virtual, or virtual to virtual, or to hosted, or to private, or to public cloud. > Pricing includes effort based on the scope of work, with SOFTWARE, LICENSES, or TOOLS needed to support the delivery of the project, and that will be charged extra as applicable.	EA
Cloud Assure Service	Migration Assist - Lift and Shift	**Migration Assist - LIFT AND SHIFT** The Lift and Shift approach is about migrating your application and associated data to the cloud with minimal or no changes. Applications are effectively "lifted" from the existing environments and "shifted" to a new hosting premises, i.e., in the cloud. As such, there are often no significant changes to make in the application architecture, data flow, or authentication mechanisms. The primary considerations in a lift and shift migration are the application's compute, storage, and network requirements that are shifted as they are. > Pricing includes effort based on the scope of work mutually agreed upon by both parties, with SOFTWARE, LICENSES, or TOOLS needed to support the delivery of the project, and that will be charged extra as applicable.	EA
Cloud Assure Service	Migration Assist - Offline Data Movement with the customer's Owned Device	**MIGRATION ASSIST – OFFLINE DATA MOVEMENT WITH CUSTOMER-OWNED DEVICE** Secure DATA migration using the customer's own storage devices for offline transfer. > In this model, customers provide their hardware (e.g., HDDs, NAS units) for offline migration. Data is extracted, securely encrypted, and ingested into the target cloud platform. > Customer needs to hand over the Physical Movable disks to Yntraa Cloud's representative at Yntraa Cloud	Per TB

		DC. If there is any logistics or transportation cost that needs to be borne by the customer.	
Cloud Assure Service	Migration Assist - Offline Data Movement with Provider Device	**MIGRATION ASSIST – OFFLINE DATA MOVEMENT WITH PROVIDER DEVICE** DATA migration using storage devices provided by the service provider (e.g., Snowball, Data Box). > The provider supplies secure storage devices for large data transfer projects. Data is loaded onto the devices at the customer's site, shipped to the provider or cloud ingestion facility, and uploaded to cloud storage. Devices are pre-configured with encryption and chain-of-custody tracking for compliance. > This includes effort for loading and ingestion, where device rental, shipping, and logistics are billed separately under Professional Service. > Any loss, damage, or late return penalties for devices are to the customer's account per contract terms.	Per TB
Cloud Assure Service	Migration Assist - Online Data Movement	**MIGRATION ASSIST – ONLINE DATA MOVEMENT** Direct, secured, wired network transfer from the customer's on-premises to the cloud using high-speed connectivity. This model enables real-time or scheduled data migration between customer data centres to cloud storage over a wired private network secured link using IPsec VPN or encryption (e.g., Direct Connect, P2P link, or IPSec VPN). > Connectivity charges like Direct Connect or IPsec VPN, or internet bandwidth charges are charged at an additional cost.	Per TB
Cloud Assure Service	Migration Assist - Online Data Transfer with Data Mover	**MIGRATION ASSIST – ONLINE DATA TRANSFER WITH DATA MOVER** Cloud-based bulk data transfer using specialised data migration software (DataSync, Storage Gateway, rsync, etc.). Utilises automated data mover tools to securely and efficiently transfer data online to cloud environments. Tools handle error recovery, throttling, synchronization, and integrity checks during migration. Best suited for continuous data replication, large file transfers, and phased migrations. > Data Mover tools, connectivity charges like Direct Connect or IPsec VPN, or internet bandwidth charges are charged at an additional cost.	Per TB

Cloud Assure Service	Migration Assist - Database Migration across Homogeneous DB	**MIGRATION ASSIST – DATABASE MIGRATION ACROSS HOMOGENEOUS DATABASE** This service is designed for organizations transitioning databases between the source and destination are the same database engines, and the schema structure, data types, and database code are compatible with the source and target databases (e.g., MS SQL to MS SQL, MySQL to MySQL, PostgreSQL to PostgreSQL). > Supports homogeneous and heterogeneous database migrations from Oracle, SQL Server, PostgreSQL, MySQL, MongoDB, MariaDB, and other databases. > SOFTWARE, or LICENSES, or TOOLS needed to support the delivery of the project will be charged extra as applicable.	Per GB
Cloud Assure Service	Migration Assist - Database Migration across Heterogeneous DB	**MIGRATION ASSIST – DATABASE MIGRATION ACROSS HETEROGENEOUS DATABASE** This service supports transitions between different database engines (e.g., SQL Server to PostgreSQL, Oracle to Aurora, and NoSQL to SQL migrations, etc). This involves adapting the application and database schemas to suit the new platform while preserving business logic, performance, and security standards. > Supports homogeneous and heterogeneous database migrations from Oracle, SQL Server, PostgreSQL, MySQL, MongoDB, MariaDB, and other databases. > SOFTWARE, or LICENSES, or TOOLS needed to support the delivery of the project will be charged extra as applicable.	Per GB
Cloud Assure Service	Migration Assist - Platform Migration	**MIGRATION ASSIST - PLATFORM MIGRATION** This service helps businesses move the complete IT infrastructure, software, applications, and data from one platform to another, often with a focus on cloud platforms. These services can involve migrating databases, content management systems (CMS), on-premises platforms, and other legacy systems. > Pricing includes effort based on the scope of work mutually agreed upon by both parties, with SOFTWARE, LICENSES, or TOOLS needed to support the delivery of the project, and that will be charged extra as applicable.	EA
Cloud Assure Service	Migration Assist - Data Centre Migration	**MIGRATION ASSIST - DATA CENTRE** This service involves moving an organization's existing IT systems, data, databases, applications, and processes from one data centre environment to another. This can be to a new physical location, a different IT infrastructure, or even a cloud-based platform. The goal is often to improve efficiency, reduce costs, increase agility, or enhance scalability > Pricing includes effort based on the scope of work	EA

		mutually agreed upon by both parties, with SOFTWARE, LICENSES, or TOOLS needed to support the delivery of the project, and that will be charged extra as applicable.	

Note: *Tools, software licenses, and third-party utilities required for discovery, automation, or migration execution are not included by default. Additional charges may apply based on the selected tools, customer environment, and scope of work.*

11. Risk Register and Mitigation Measures

Migration projects, by nature, involve technical, operational, and business risks. Identifying these early and implementing mitigation strategies is key to ensuring a smooth transition.

Risk Category	Example Risks
Technical	Tool incompatibility, network latency, and data corruption during transfer
Operational	Extended downtime, misaligned maintenance windows
Resource Availability	SME unavailability, delayed access to systems
Third-Party Dependencies	Delays from OEM, ISP, or other vendors
Scope Creep	Additional workloads or features requested mid-migration

12. Why Select Migration Assist?

Yntraa Cloud helps organizations migrate workloads to the cloud through a structured, low-risk approach that ensures stability, performance, and business continuity. Whether modernizing legacy systems or moving across cloud platforms, our methodology aligns with your transformation goals.

- **Seamless Transition with No or at least Disruption**
  The migration process is carefully orchestrated to ensure smooth workload movement with no adverse impact on ongoing business activities.
- **Downtime Minimization Through Proven Methodologies**
  With well-defined cutover strategies and rehearsed transition plans, workload migrations are executed with minimal downtime.
- **End-to-End, One-Stop Solution for Cloud Migration**
  This service provides a unified approach to all migration types—covering planning, execution, and validation. It supports infrastructure, applications, databases, and data migrations, eliminating the need for multiple vendors and ensuring a seamless transition.
- **Data Integrity and Safety Assured**
  Migration procedures incorporate rigorous validation, automated checks, and rollback protocols to safeguard data throughout the process.
- **Phased Execution for Controlled Progress**

Workloads are migrated in structured waves, allowing for focused execution, early issue detection, and iterative improvement.

- **Embedded Governance, Security, and Compliance**
  All migrations are aligned with predefined security policies, compliance requirements, and organizational governance standards.
- **Expert-Led Migration Team**
  Our seasoned migration specialists bring deep technical expertise and proven methodologies to ensure smooth, secure, and efficient transitions to the cloud.
- **Tailored Modernization Options**
  Where applicable, legacy workloads are assessed for modernization opportunities, replatforming, containerization, or adopting PaaS models—to align with long-term business goals.
- **Risk Mitigation and Performance Optimization**
  Migration activities are informed by prior assessment outcomes, performance benchmarks, and impact analysis, ensuring optimal resource alignment and reduced risk exposure.

13. About Yntraa Cloud

Yntraa Cloud is an indigenous, hyper-scale cloud platform built for enterprises with India on their mind. From foundational infrastructure to advanced managed services, Yntraa Cloud empowers organizations to build, scale, and optimize their cloud journeys with agility, resilience, and compliance. Our comprehensive cloud portfolio spans across:

Whether you're modernizing legacy systems or building cloud-native innovations, Yntraa Cloud offers the tools, services, and strategic support to accelerate your digital transformation securely and efficiently.

For more information, please visit www.yntraa.com
